DRAINAGE STRATEGY
(Rev C)

30th APRIL 2025

Issue Sheet.

Prepared	Date		Checked	Date
MJM	31-01-25		JD	31-01-25

Revisions	Comment	Date
A	Initial Issue	31-01-25
B	Drainage plans updated	14-02-25
C	Drainage plans updated	30-04-25

The report is based on the information that has been acquired and / or made available to John Davies Associates Limited via the various searches and consultations undertaken as part of the Drainage Strategy Report. In some cases, anecdotal information has been relied upon, where documented evidence has been lacking.

The conclusions drawn in the following report are considered correct although any subsequent additional information may allow refinement of the conclusions.

All work carried out in preparing this report has utilised and is based upon John Davies Associates current professional knowledge and understanding of current UK standards and codes, technology and legislation. Changes in this legislation and guidance may occur at any time in the future and cause any conclusions to become inappropriate or incorrect.

This report has been prepared using information contained in maps and documents prepared by others. John Davies Associates can accept no responsibility for the accuracy of such information.

1 Introduction

- 1.1 This document is provided as a drainage strategy to discharge a planning condition for a proposed development located at a piece of land off Woodstock Gardens in Hayes, London.
- 1.2 The site is surplus land belonging to 43A Woodstock Gardens and is considered greenfield land.
- 1.3 The overall site area is approx. 644m² (0.064ha), the site is bounded on all side by existing residential dwellings, to the northeast corner of the site is an existing driveway off Woodstock Gardens from which the site is accessed.
- 1.4 The nearest postcode is UB4 8BA and the co-ordinates are 509492E, 181810N, see below for location plan.

- 1.5 The proposal is the construction of a 3-bedroomed dwelling in the garden space adjacent to 43A, this includes new driveway and parking spaces. (See Appendix A for the layout plans).

2 Existing Drainage

- 2.1 The local water authority is Thames Water, we have obtained the sewer records and there is an existing foul and surface water sewer under Woodstock Gardens. (See Appendix B for sewer records).
- 2.2 As there is an existing dwelling on the site then it is expected that there should be existing connections located on site, at the time of writing no survey had been undertaken therefore we were unable to comment further.

3 Proposed Surface Water Drainage

- 3.1 In accordance with the SUDS hierarchy when considering surface water drainage then consideration to each of the below discharge options should be considered in sequence:

- 3.2 Soakaway testing has been undertaken on site and failed to achieve a positive result, it has therefore been concluded that soakaways are not viable on this site. (See Appendix C for soakaway results).
- 3.3 Next in the SUDS hierarchy would be to discharge to a water course but as there are no watercourses in the vicinity of the site then this has also been discounted.
- 3.4 Therefore it is proposed to connect into the public surface water sewer under Woodstock gardens. A survey should be undertaken to investigate the existing on site sewers for the potential of connecting into the public sewer via an existing connection.

- 3.5 The site is a greenfield site and therefore the surface water runoff should be restricted to exiting greenfield rates, which for this site are as follows: (see appendix D for greenfield calc):

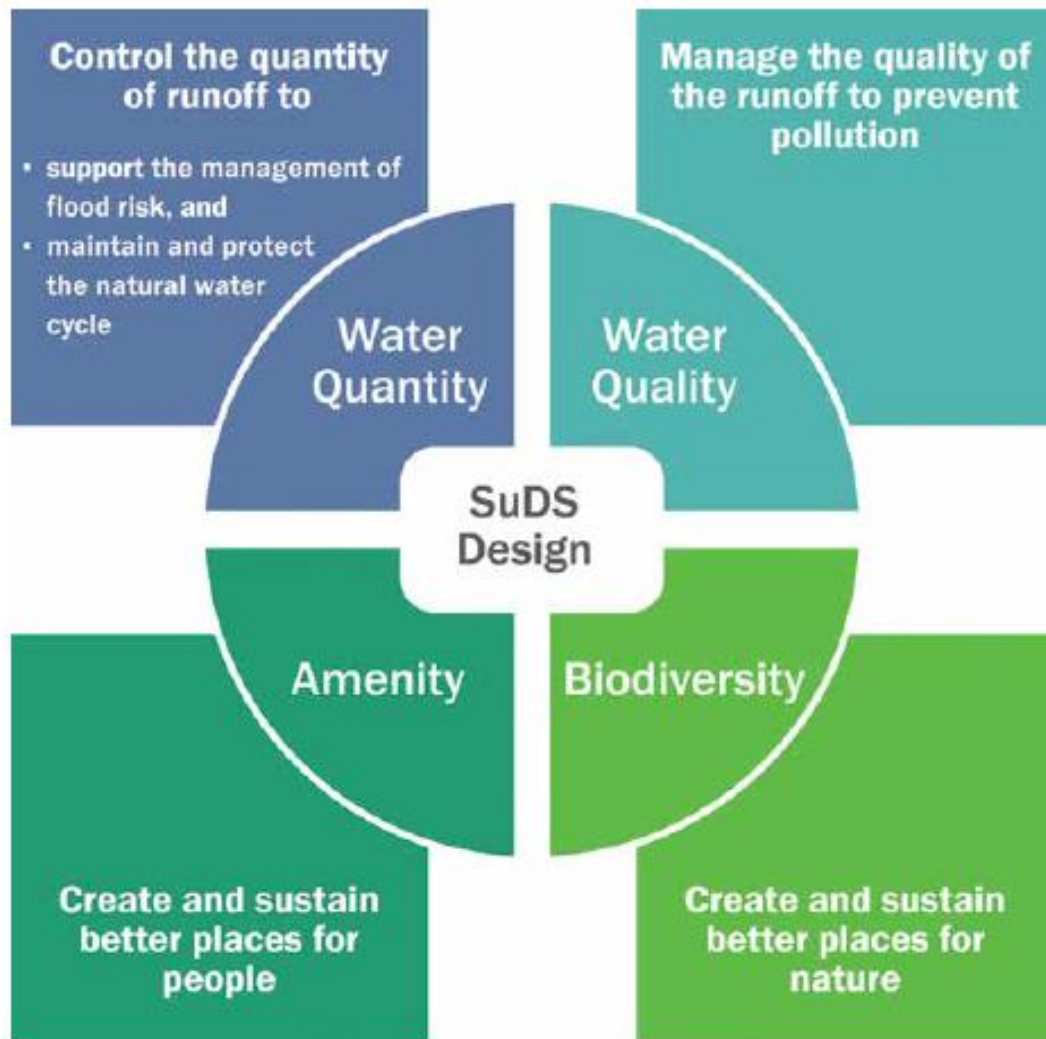

$$\begin{aligned} \text{QBar} &= 0.42 \text{ l/s} \\ 1 \text{ in 1Year} &= 0.36 \text{ l/s} \\ 1 \text{ in 30 Year} &= 0.96 \text{ l/s} \\ 1 \text{ in 100 Year} &= 1.34 \text{ l/s} \end{aligned}$$

- 3.6 It is considered that the above QBAR rate is too low to be practically achievable as the orifice required would be such as size that it would be at risk of frequent blockages, therefore it is proposed to restrict the flow to **1.0l/s** which is less than the equivalent 1 in 100 Year event.

- 3.7 The site is therefore proposed to discharge to the public surface water sewer via a new connection on the public sewer manhole, with a restricted discharge rate of **1.0 l/s** with attenuation provided on site in the sub-base of the permeable paving, sized to accommodate the **1 in 100 year + 40%** climate change rainfall event. (See Appendix E for the drainage layout and Appendix F for drainage calcs)

4 SUDS

- 4.1 All new surface water should be designed in accordance with 'The SUDS Manual' which identifies 4 pillars of a sustainable drainage solution, these four elements are shown as:

- 4.2 **WATER QUANTITY:** The surface water from the site is being restricted to the equivalent greenfield runoff rates of 1.0 l/s which attenuation on site in the sub-base of the permeable paving, we have also incorporated the use of rain gardens where practical.
- 4.3 **WATER QUALITY:** All the new roof and hard paved areas are being discharged via permeable paving which offers 2 levels of treatment, as well the rain gardens where possible.
- 4.4 **AMENITY AND BIODIVERSITY:** New Garden areas are being provided to the new dwelling, due to the size of the site then no other amenity space is practical.

4.5 All new surface water drainage systems should implement SUDS features where reasonably possible, these features are incorporated to offer benefits in Water Quality, Water Quantity, Amenity and Biodiversity. Below we have considered each SUDS element and determined its use within this particular development.

COMPONENT	SUITABILITY	REASON
Rainwater Harvesting	✓	Potential for a rainwater harvesting unit to be placed in the rear garden of each property.
Green Roof	X	Roof is pitched and therefore not suitable for a Green Roof.
Blue Roof	X	Roof is pitched and therefore not suitable for a Green Roof.
Infiltration Systems	X	Infiltration is not suitable on this site.
Proprietary Treatment Systems	✓	Flow control device to be utilised.
Filter Strips	X	Infiltration is not suitable on this site.
Filter Drains	X	Infiltration is not suitable on this site.
Swales	X	Infiltration is not suitable on this site / Insufficient space.
Bioretention Systems	X	Insufficient land available.
Trees	✓	New trees have been included in the rear gardens.
Pervious Pavements	✓	All parking bays are permeable paving.
Attenuation Storage Tanks	X	Storage is being provided in the subbase of the permeable paving.
Detention Basins	X	Insufficient land available.
Ponds and Wetlands	X	Insufficient land available.

5 Proposed Foul Drainage

- 5.1 The new foul drainage is proposed to discharge to the public foul sewer via an existing connection located on site.

6 SUDS Operations and Maintenance Plan

- 6.1 The proposed drainage strategy consists of several SUDS elements which can have different responsibilities on the operation and maintenance and each one will require routine checks and repairs, these different SUDS elements and their require maintenance are as outlined in the table below.

ELEMENT	RESPONSIBILITY		
	PUBLIC	PRIVATE	MAINTENANCE COMPANY
RAINWATER HARVESTING			✓
FLOW CONTROL			✓
PERMEABLE PAVING			✓

6.2 RAINWATER HARVESTING

Maintenance schedule	Required action	Typical frequency
Regular maintenance	Inspection of the tank for debris and sediment build-up, inlets/outlets/withdrawal devices, overflow areas, pumps, filters	Annually (and following poor performance)
	Cleaning of tank, inlets, outlets, gutters, withdrawal devices and roof drain filters of silts and other debris	Annually (and following poor performance)
Occasional maintenance	Cleaning and/or replacement of any filters	Three monthly (or as required)
Remedial actions	Repair of overflow erosion damage or damage to tank	As required
	Pump repairs	As required

6.4 FLOW CONTROL DEVICE MAINTENANCE

Maintenance schedule	Required action	Typical frequency
Routine maintenance	Remove litter and debris and inspect for sediment, oil and grease accumulation	Six monthly
	Change the filter media	As recommended by manufacturer
	Remove sediment, oil, grease and floatables	As necessary – indicated by system inspections or immediately following significant spill
Remedial actions	Replace malfunctioning parts or structures	As required
Monitoring	Inspect for evidence of poor operation	Six monthly
	Inspect filter media and establish appropriate replacement frequencies	Six monthly
	Inspect sediment accumulation rates and establish appropriate removal frequencies	Monthly during first half year of operation, then every six months

6.6 PERMEABLE PAVING MAINTENANCE

Operation and maintenance requirements for pervious pavements		
Maintenance schedule	Required action	Typical frequency
Regular maintenance	Brushing and vacuuming (standard cosmetic sweep over whole surface)	Once a year, after autumn leaf fall, or reduced frequency as required, based on site-specific observations of clogging or manufacturer's recommendations – pay particular attention to areas where water runs onto pervious surface from adjacent impermeable areas as this area is most likely to collect the most sediment
Occasional maintenance	Stabilise and mow contributing and adjacent areas	As required
	Removal of weeds or management using glyphosate applied directly into the weeds by an applicator rather than spraying	As required – once per year on less frequently used pavements
Remedial Actions	Remediate any landscaping which, through vegetation maintenance or soil slip, has been raised to within 50 mm of the level of the paving	As required
	Remedial work to any depressions, rutting and cracked or broken blocks considered detrimental to the structural performance or a hazard to users, and replace lost jointing material	As required
	Rehabilitation of surface and upper substructure by remedial sweeping	Every 10 to 15 years or as required (if infiltration performance is reduced due to significant clogging)
Monitoring	Initial inspection	Monthly for three months after installation
	Inspect for evidence of poor operation and/or weed growth – if required, take remedial action	Three-monthly, 48 h after large storms in first six months
	Inspect silt accumulation rates and establish appropriate brushing frequencies	Annually
	Monitor inspection chambers	Annually

7 Flood Exceedance Event

- 7.1 Although the drainage has been designed to accommodate the 1 in 100 year + 40%cc rainfall event consideration has to be given to the exceedance event to the drainage, this is the event where the surface water system is pushed to such a point that it is forced to flood so that the resultant flow paths can be identified on a plan. (See Appendix G for plan).

Asset Location Search - Sewer Key

Public Sewer Types (Operated and maintained by Thames Water)

	Foul Sewer: A sewer designed to convey waste water from domestic and industrial sources to a treatment works.
	Surface Water Sewer: A sewer designed to convey surface water (e.g. rain water from roofs, yards and car parks) to rivers or watercourses.
	Combined Sewer: A sewer designed to convey both waste water and surface water from domestic and industrial sources to a treatment works.
	Storm Sewer
	Sludge Sewer
	Foul Trunk Sewer
	Surface Trunk Sewer
	Combined Trunk Sewer
	Foul Rising Main
	Surface Water Rising Main
	Combined Rising Main
	Vacuum
	Thames Water Proposed
	Vent Pipe
	Gallery

Other Sewer Types (Not operated and maintained by Thames Water)

	Sewer		Culverted Watercourse
	Proposed		Decommissioned Sewer
	Content of this drainage network is currently unknown		Ownership of this drainage network is currently unknown

Notes:

- 1) All levels associated with the plans are to Ordnance Datum Newlyn.
- 2) All measurements on the plan are metric.
- 3) Arrows (on gravity fed sewers) or flecks (on rising mains) indicate the direction of flow.
- 4) Most private pipes are not shown on our plans, as in the past, this information has not been recorded.

Sewer Fittings

A feature in a sewer that does not affect the flow in the pipe. Example: a vent is a fitting as the function of a vent is to release excess gas.

	Air Valve		Meter
	Dam Chase		Vent
	Fitting		

Operational Controls

A feature in a sewer that changes or diverts the flow in the sewer. Example: A hydrobrake limits the flow passing downstream.

	Ancillary		Drop Pipe
	Control Valve		Weir

End Items

End symbols appear at the start or end of a sewer pipe. Examples: an Undefined End at the start of a sewer indicates that Thames Water has no knowledge of the position of the sewer upstream of that symbol. Outfall on a surface water sewer indicates that the pipe discharges into a stream or river.

	Inlet		Outfall
	Undefined End		

Other Symbols

Symbols used on maps which do not fall under other general categories.

	Change of Characteristic Indicator		Public / Private Pumping Station
	Invert Level		Summit

Areas

Lines denoting areas of underground surveys, etc.

	Agreement
	Chamber
	Operational Site

Ducts or Crossings

	Casement	Ducts may contain high voltage cables. Please check with Thames Water.
	Conduit Bridge	
	Subway	
	Tunnel	

5) 'na' or '0' on a manhole indicates that data is unavailable.

6) The text appearing alongside a sewer line indicates the internal diameter of the pipe in millimeters. Text next to a manhole indicates the manhole reference number and should not be taken as a measurement. If you are unsure about any text or symbology, please contact Property Searches on 0800 009 4540.

SOAKAWAY TEST REPORT

Version Control Record				
Issue	Description of Status	Date	Reviewer Initials	Authors Initials
01	Draft Report	21:01: 25	SD	JCD

This report has been prepared by John Davies Associates with all reasonable care, skill and diligence and taking account of the Contract between John Davies Associates and its Client, Sohail Iqbal Ltd This report is confidential to the Client and John Davies Associates accepts no liability whatsoever to any Third Parties to whom this report or any part thereof is made known unless formally agreed beforehand by John Davies Associates.

1.0 INTRODUCTION

- 1.1 Pankaj Dhir Esq; has instructed John Davies Associates, Consulting Engineers to undertake Soakaway Tests on his site at 43A Woodstock Gardens, Hayes London UB4 8BA as a pre-cursor to the design of a Sustainable Urban Drainage Scheme for the proposed development of the site with a new three bedroomed house.
- 1.2 The site is an area of undeveloped land on the southern side of the garden to No 43A Woodstock Gardens which is shown edged red on the site location plan at Figure 1.

FIGURE 1 – SITE LOCATION PLAN.

- 1.3 A sustainable urban drainage system is to be employed in connection with the disposal of the storm water arising from the proposed new house. The first step in this process is to establish whether the strata beneath the proposed development site is capable of allowing stormwater from the proposed new house to be disposed of via one or more soakaways on the site.
- 1.4 Arrangements were made for a Soakaway Test in accordance with BRE 365 to be undertaken on Thursday 23rd January 2025 which were overseen by Mr. J.C. Davies M.Sc. C.Eng., FICE, MCIOB who was assisted by staff from a local Contractor; and their very helpful assistance is gratefully acknowledged.
- 1.5 The weather at the time of the soakaway test was fine but cold and cloudy, following a cold, dry night.
- 1.6 The position of the proposed location for a soakaway was chosen because it was in an area of undeveloped land which was sufficiently clear of the vehicles and other materials stored on the site to enable the mini-digger to safely operate. It was also located towards the centre of the site and therefore deemed representative of the area.
- 1.7 The first 1.3m length of the test trench was excavated to a depth of 1.20m when ground water started to ingress into the excavation. As the excavation progressed more water was seen to enter the trench once it reached a depth of 1.2m
- 1.8 At this point the trench excavation was halted and a trial pit 1.0m x1.0m was excavated and again at a depth of 1.2m ground water began to ingress into the trial pit.
- 1.9 The excavation of the trial pit continued for a further 0.5m by which time it was clear that the standing water in the site was at a depth of 1.200m below existing ground level.
- 1.10 Photograph 1 shows the standing water in the trial pit at 9.30am.
- 1.11 In view of the water table being so high it was concluded that soakaways would not be suitable for the disposal of stormwater from the proposed new development, as the Building Regulations require that there is at least 1m depth of free draining material between the underside of the soakaway and the top of the standing groundwater level.

Photograph 1 Showing Standing Water at 1.2m in Trial Pit

1.12 Photograph 2 shows the level of the standing water in the Trial Pit at 17.49.

Photograph 2 Showing Level of Standing Water at 17.49

2 CONCLUSIONS

- 2.1 It is concluded that due to the high level of the water table under this site it will not be possible to dispose of the stormwater by soakaways and therefore an alternative method of disposal for the stormwater must be used.

Appendix D
Greenfield Calc

Calculated by:	Michael Micklethwaite
Site name:	Woodstock gardens
Site location:	London

This is an estimation of the greenfield runoff rates that are used to meet normal best practice criteria in line with Environment Agency guidance "Rainfall runoff management for developments", SC030219 (2013) , the SuDS Manual C753 (Ciria, 2015) and the non-statutory standards for SuDS (Defra, 2015). This information on greenfield runoff rates may be the basis for setting consents for the drainage of surface water runoff from sites.

Site Details

Latitude:	51.52454° N
Longitude:	0.42282° W
Reference:	642267497
Date:	Jan 31 2025 08:38

Runoff estimation approach

IH124

Site characteristics

Total site area (ha):

0.1

Methodology

Q _{BAR} estimation method:	Calculate from SPR and SAAR
SPR estimation method:	Calculate from SOIL type

Notes

(1) Is $Q_{\text{BAR}} < 2.0 \text{ l/s/ha}$?

When Q_{BAR} is $< 2.0 \text{ l/s/ha}$ then limiting discharge rates are set at 2.0 l/s/ha .

Soil characteristics

	Default	Edited
SOIL type:	4	4
HOST class:	N/A	N/A
SPR/SPRHOST:	0.47	0.47

(2) Are flow rates $< 5.0 \text{ l/s}$?

Where flow rates are less than 5.0 l/s consent for discharge is usually set at 5.0 l/s if blockage from vegetation and other materials is possible. Lower consent flow rates may be set where the blockage risk is addressed by using appropriate drainage elements.

Hydrological characteristics

	Default	Edited
SAAR (mm):	620	620
Hydrological region:	6	6
Growth curve factor 1 year:	0.85	0.85
Growth curve factor 30 years:	2.3	2.3
Growth curve factor 100 years:	3.19	3.19
Growth curve factor 200 years:	3.74	3.74

(3) Is $\text{SPR/SPRHOST} \leq 0.3$?

Where groundwater levels are low enough the use of soakaways to avoid discharge offsite would normally be preferred for disposal of surface water runoff.

Greenfield runoff rates

	Default	Edited
Q _{BAR} (l/s):	0.42	0.42
1 in 1 year (l/s):	0.36	0.36
1 in 30 years (l/s):	0.96	0.96
1 in 100 year (l/s):	1.34	1.34
1 in 200 years (l/s):	1.57	1.57

This report was produced using the greenfield runoff tool developed by HR Wallingford and available at www.uksuds.com. The use of this tool is subject to the UK SuDS terms and conditions and licence agreement , which can both be found at www.uksuds.com/terms-and-conditions.htm. The outputs from this tool are estimates of greenfield runoff rates. The use of these results is the responsibility of the users of this tool. No liability will be accepted by HR Wallingford, the Environment Agency, CEH, Hydrosolutions or any other organisation for the use of this data in the design or operational characteristics of any drainage scheme.

Appendix G
Flood Exceedance Layout & Calcs

EXISTING SEWERS TO BE INVESTIGATED ON SITE
FOR BOTH SURFACE AND FOUL WITH THE
INTENTION OF UTILISING AN EXISTING CONNECTION

Notes

1. This drawing is produced for use in this project only and may not be used for any other purpose. The consulting Engineers accept no liability for the use of this drawing other than the purpose for which it was intended in connection with this project as recorded on the title block fields 'Purpose for Issue' and 'File Status Code'.
2. This drawing may not be reproduced in any form without prior written agreement.
3. Do not scale from the drawing, use written dimensions only.
4. All dimensions are in millimetres unless otherwise specified.
5. Discrepancies must be reported back to the engineer prior to construction.
