

Specification for planting and cultivation

1. Scope of Work:

The scope of work includes the supply, installation, and cultivation of plants as specified in the landscape design plans for the residential property located at 23 Victoria Avenue.

2. Plant Selection:

All plants shall be selected according to the landscape design plans, taking into consideration site conditions, climate, soil type, and aesthetic preferences.

Native species shall be prioritized where appropriate to support local ecosystems and reduce maintenance needs.

3. Planting Materials:

All plants shall be sourced from reputable nurseries or suppliers and shall be of healthy, disease-free stock.

Plant sizes and quantities shall conform to the specifications outlined in the landscape design plans.

4. Site Preparation:

Prior to planting, the site shall be properly prepared, including clearing of debris, removal of weeds, and amendment of soil as necessary.

Soil amendments such as organic matter, compost, or soil conditioners shall be incorporated to improve soil structure, fertility, and drainage.

5. Planting Method:

Planting holes shall be dug to the appropriate depth and width, accommodating the root ball size of each plant.

Plants shall be positioned at the correct depth to ensure proper root establishment and stability.

Backfilling of soil around the roots shall be done carefully, ensuring that air pockets are eliminated and soil is firmly packed.

6. Spacing and Layout:

Plant spacing and layout shall adhere to the specifications provided in the landscape design plans, ensuring adequate room for mature growth and proper aesthetic balance.

Consideration shall be given to factors such as plant height, spread, and cultural requirements when determining placement.

7. Mulching:

After planting, a layer of organic mulch such as shredded bark, wood chips, or compost shall be applied around the base of each plant.

Mulch shall be spread to a uniform depth of approximately 2 to 3 inches (5 to 7.6 centimeters) to conserve soil moisture, suppress weeds, and regulate soil temperature.

8. Irrigation:

An appropriate irrigation system shall be installed to ensure adequate water supply for newly planted vegetation.

Irrigation shall be scheduled based on plant water requirements, weather conditions, and seasonal variations to promote healthy growth and establishment.

9. Fertilization:

A balanced, slow-release fertilizer shall be applied to newly planted areas according to manufacturer's recommendations.

Additional fertilization may be required based on soil test results, plant nutrient deficiencies, and seasonal needs.

10. Maintenance:

Regular maintenance shall be provided following the completion of planting works, including watering, mulching, weeding, and monitoring for pest and disease issues.

Maintenance activities shall be conducted by the owner in accordance with industry best practices and tailored to the specific requirements of the landscape design.

11. Completion and Handover:

Upon completion of planting and cultivation works, the site shall be inspected to ensure that all tasks have been carried out to the satisfaction of the client and in accordance with the landscape design plans.

Any deficiencies shall be addressed promptly, and the landscape project shall be formally handed over to the client with appropriate documentation.
