

Energy Monitoring, Recording and Reporting Plan Hayes Park Central & South

This statement has been prepared to support the discharge of Condition 19 and outlines the approach to energy monitoring, recording and reporting for the development.

Energy consumption within the development will be monitored through installed metering associated with the building services systems, including the air source heat pump systems and electrical supply.

Each dwelling will be provided with appropriate metering to enable the monitoring of energy consumption. In addition, landlord and communal energy use will be metered where applicable.

Energy data will be recorded through the installed systems and will be available for review in accordance with the approved energy strategy.

The monitoring approach aligns with the requirements of London Plan Policy SI2 and will enable the assessment of operational energy performance of the development.

This approach ensures that energy use can be monitored and reviewed over time, and that the development operates in line with the approved energy strategy.
