Overview

This 6ft Closeboard Panel from Forest is a strong, sturdy and secure panel, perfect for privacy and security along garden boundaries.

It features thick overlapping square cut 8mm boards, arranged vertically and sandwiched by a frame all the way round. There is further reinforcement from 3 additional horizontal battens. The finish is rough sawn timber that is Dip Treated to give a 10 year Anti-Rot guarantee, with periodic re-treatment, and an attractive golden brown colour.

Close Board Panels

Pretty good panels but you have to be careful of the rails that have gone a bit squiffy and protrude through the edge of the panels.

vs

Most liked negative review

★ ★

Really poorly made panel

Terribly made panels. Had seven delivered today and found all of them badly out of square with loose and poorly fitted battens. One was at least 6 inches out of square. Not

EO Genius

Modular, scalable and future proof smart charger for electric vehicles. Designed for fleets, workplaces, apartments and destinations.

Add the EO Hub to unlock all our smart charging options and get access to the EO Cloud platform.

Installation & Warranty

- + Unique wall plate connector for quick deployment and future upgrade.
- + 3-year product warranty with options to extend.

Features

- + Mennekes branded locking Type 2 universal socket as standard.
- + Power Ratings: Single Phase up to 7.2kW // Three phase up to 22kW.
- + Wall or post mounted with EO Post.
- + RFID.
- + Available in two colours: Black & White.

Intelligence

- + Add EO Hub to enable communications with EO Cloud back-office.
- + Static, dynamic & scheduled active load management via EO Cloud.
- + EO App smartphone integration via EO Cloud.

Description

ACO Threshold channel drain is designed for use in domestic properties to eliminate any water from pooling at external doors. The threshold is only 60mm wide and sits flush to the door for maximum discretion, allowing water to be drained away quickly and efficiently. Whilst ACO Threshold channel drain has been built with long-life and durability in mind, a choice of built-in silver or black Heelguard grates offer aesthetic design too.

This ACO Threshold channel drain comes with an attached silver aluminium grate with Heelguard design. Heelguard design means that high heels can't become lodged in the grate as the slits are too narrow, reducing the risk of injury to people entering and exiting the property or damage to the channel drain grate. The extruded plastic base of ACO Threshold channel drain only bolsters the security of the drain once the system has been bedded in concrete.

ACO Threshold channel drain can be connected, thanks to 80mm diameter outlets, to domestic soakaways and accessories like a drain connector. 80mm bottom outlet and closing end cap complete the drain system.

Ramp and Driveway Ice & Snow Melting Systems

For Ramps, Driveways and Car Parks

Ramp & Drive Ice & Snow Melting Features

- Fully automated clearance of ice and snow
- Improved safety for vehicles and pedestrians
- Maintain access by keeping loading ramps and bridges safe for use
- Save staff time on clearing ice and snow
- Save money on salt and grit and reduce the environmental impact on the surrounding area and water courses
- Reduce the damage caused to asphalt and concrete surfaces
- Intelligent thermostats monitor ground temperature and moisture levels to minimise energy usage
- Proven systems from Scandinavia
- Independently control two separate areas of heating via a single thermostat
- A choice of thermostats compatible with your individual requirements
- Optional moisture sensors can reduce energy usage by up to 80%

Driveway Heating System Thermostat
FRO-47A-STAT

Outdoor Heating Cable PKC-70

Ground Temperature and
Moisture Sensor FRO-GRO-SENS

Automated Ramp, Driveway and Car Park Heating

Heat Mat's Scandinavian designed ice & snow melting systems can be used beneath virtually any surface to ensure it remains free from dangerous ice and snow build-up. The robust heating wire systems are suitable to protect driveways, car parks, pathways, steps, loading ramps and bridges and when used in conjunction with intelligent thermostats they provide an energy efficient and fully automated heating system.

Custom made ice and snow melting thermostats monitor both the ground temperature and the moisture level to ensure that they only operate when they are really needed. The thermostats are fully programmable and can be set up for the specific local conditions as required.

In addition to ensuring that driveways and walkways remain free of dangerous ice and snow build-up the heating systems also prevent the need to use salt to keep areas clear, minimising costs and also ensuring both the road surface and the surrounding environment are not damaged or contaminated by salt build-up.

- Improved safety for vehicles and pedestrians as surfaces are automatically safe to drive and walk on
- Automated clearance of ice and snow, ensuring that Health and Safety requirements can be met and that the first person on site does not have to make the area safe
- Surfaces (particularly concrete) are not damaged by grit and salt, and are also protected from the normal freeze/thaw activity in winter
- The surrounding ground and waterways are protected from salt pollution
- A number of different sensors and timers can be combined to ensure that the system only operates when it is required, minimising energy usage
- Entirely maintenance free. Once the system is installed there is no requirement for any maintenance work and some systems include an automatic alarm warning if the system fails for whatever reason
- A tried and trusted system. These systems have been used in Scandinavia for more than a decade and have proved their worth in extreme temperatures and weather conditions

Suitable product ranges

Ice & Snow
thermostats

In-screed cable

Self-limiting
heating cable

Choice of output

For normal installations we recommend an output of around 270W/sqm which provides a good balance between speed of operation and power requirements. Often the limiting factor to the size of area which can be heated is the available power supply on site, and with restricted power supplies it is often possible to specify a lower powered system which will still clear the ice and snow.

Tyre track heating

Where a long driveway requires heating it is quite acceptable to simply heat two tyre tracks leaving other areas unheated. This saves on the power requirements and installation and running costs and it allows longer driveways to be heated than would otherwise be possible.

Drainage channel heating

When heating a driveway or path area it is vital to ensure that the water can safely run away, and does not become pooled to then refreeze. When heating a driveway area we recommend that trace heating cables are installed into the drainage channels to ensure complete clearance.

Installation methods

There are a number of different installation methods, although all of them involve fixing down outdoor heating cable to Heat Fix metal bands or zip-tying it onto reinforcement mesh. A rough overview of the three most popular installation methods is detailed below; please contact Heat Mat technical support for more details.

Specialist cables for hot asphalt

There are two installation options for use with hot asphalt. The most efficient is to use our specialist

cables which can be laid directly beneath hot asphalt, and the alternative is to use a standard cable which will need to be covered with a minimum of 10mm of sand and the asphalt cooled before laying. The normal method of installation beneath asphalt would be to level the current surface. If the surface is concrete or similar Heat Fix strips can be nail-gunned to the base and the cable installed onto these. If the surface is not concrete or similar a layer of 30mm of sand or finely crushed stone should be laid with a wire mesh placed on top of this, and the cables zip-tied in place. The asphalt layer should be a minimum of 55mm thick.

Block paving

Care must be taken not to drop any paving slabs onto the cable during the installation process as these could damage the heating system. The normal method of installation would be to level the current surface and lay a 60mm layer of sand/grit and compact this as required. A wire mesh would then be laid on top of this layer and the heating cables would be zip-tied in place. A further 40-50mm layer of sand/grit would then be laid on top and this would be compacted by hand to ensure no damage to the heating cables. The block paving could then be laid, and to achieve the greatest benefit from the heating system the blocks should be between 50 and 80mm thick.

Concrete

Heating cables are often installed into concrete bases as concrete is particularly prone to damage from rock salt and freeze/thaw activity. The standard installation method would be to level the existing base before covering it with a support layer of sand/grit 30-40mm deep. A reinforcement mesh should then be laid and the cables can be zip-tied in place on this, before placing a layer of sand on top to protect the cables; this should be a minimum of 10mm thick. The concrete can now be poured and it should form a layer with a minimum depth of 50mm, and the concrete mix must not include sharp stones as these could damage the cables.

Overview

The 6ft Vertical Tongue & Groove Gate from Forest is made with high-quality 12mm interlocking boards, creating a strong and robust gate.

It uses the same construction as Forest's Vertical Tongue & Groove Fence Panels making an ideal match, as well as being a stylish stand-alone gate that is ideal for side-accesses to back gardens.

Housed in a rebated frame this is a substantial gate that looks great and offers a high level of security.

Made from Pressure Treated timber with a 15 year guarantee against rot and decay.

Overview

Schwegler Sparrow Terrace 1SP

Numbers of house sparrows in the UK have been tumbling, our population of six million pairs is half what it was in 1980. The good news is that the decline is levelling out, and there has actually been increases in many localities. One satisfying way to help sparrows is in providing a Sparrow Terrace nesting box. Sparrows are highly sociable birds that like to nest in

Sparrow House Occupants

House and tree sparrows, and in some instances other birds which use nest boxes such as tits, redstart and spotted flycatcher.

Sparrow Terrace Siting:

On all types of houses in built-up areas, industrial and agricultural buildings such as barns and factories.

Installation:

2 meters or more above ground level.

Option 1: Simple, surface installation using the plugs and screws supplied.

Option 2: Complete installation as a nesting block within brick or concrete walls. To avoid conducting low temperatures please also use wall insulation, or install at a suitable depth in the wall.

Cleaning

Advised but not essential. By turning the screw hook by 180° the front panel can be removed.

Dimensions of Sparrow Terrace brood chambers:

Each: height 16 x width 10.5 x depth approx. 15 cm

Overall: 245H x 430W x 200D mm

Weight: 13kg

Colour options:

Brown or Stone.

Overview

Brushwood Robin Nester

This robin nest pocket has been designed specifically with the knowledge that robins prefer an open nesting box with easy access, but robins also like a concealed nesting site. This robin nester really fits the bill, having been manufactured from brushwood with a rattan landing platform and nest divider, it makes for a very purposeful and natural nest for robins that can be fixed in an outbuilding such as a shed or porch, or safely stowed into low level foliage where robins love to nest and hideaway.

About this product

Swifts spend just four months in Europe over the summer and during this time they use urban areas around our homes and buildings to provide nesting sites. Renovation and rebuilding of older houses means that many of these preferred spaces, such as under roofs, attics or tiles, are often blocked so that they cannot find sufficient nest sites. These Swift Nest Boxes from Schwegler can help this species by providing valuable nesting locations and the installation of several units is an ideal way to support a swift colony. These boxes have been used across Europe with great success for many decades.

The Swift Box No. 17A is made from a special mixture of compressed plant fibres and concrete which enables it to provide good insulation and an extremely long life. This is an extended version of the No. 17 Standard Swift Box (<http://www.nhbs.com/title.php?tefno=162187>) and can accommodate three pairs of swifts in parallel. This assists in the rapid formation of swift colonies. The box is supplied in a natural grey colour but can be painted to match the background using an air-permeable paint.

This box should be installed at least six to seven metres above the ground, ensuring that there is unobstructed access for birds entering and leaving. If possible, boxes should be sites under the shelter of eaves or overhanging roofs. They can also be installed on steep rock faces. The box can be opened by rotating the circular plate containing the entrance hole by 90° and removing it. Cleaning can then be performed although, in boxes which are occupied by swifts, this is not essential.

The 17A Swift Box is supplied with two L-shaped fixing brackets and screws.

You may also be interested in the Swift Box 17B (<https://www.nhbs.com/no-17b-schwegler-swift-nest-box-single-cavity>) which is a modified version of the Standard Swift Box (<http://www.nhbs.com/title.php?tefno=162187>) but which has an enlarged brood chamber.

Specification

- Material: Plant fibre and wood-concrete (100% asbestos-free)
- Internal dimensions: 14 x 14 x 30cm
- External dimensions: 15 x 15 x 98cm
- Weight: 7.1kg

About this product

The Vivara Pro Build-in WoodStone Bat Box has been specifically designed to fit into the cavity of house walls. It features a slim sized entrance hole which can sit flush in a course of bricks to provide a discreet entry way for bats. It is manufactured from hard-wearing WoodStone and plywood with removable side panels so that several boxes can be placed side by side. Position the box at least 2m above ground level away from artificial light sources. WoodStone is a mixture of sawdust from FSC wood sources and concrete, and it is designed to last for years. It is breathable so there will be no problems with condensation and Woodstone maintains a consistent temperature inside, providing excellent insulation for roosting bats.

Dimensions: (H) 500 x (V) 210 x (D) 150mm. Weight: 5.6kg
