

REFURBISHMENT SURVEY

For Asbestos Containing Materials

Site Name: Bungalow , London meat company , Sheds, Two storey storage unit, Veterinary Clinic

Site address: The Elms, 371A High Street, Harlington, Hayes, Greater London, UB3 5DQ

Report Ref: J043984

Date: 20 July 2023 to 21 July 2023

Prepared for: Clifford Devlin

Prepared by: Global Safety & Environmental Limited

Report Ref: J043984

Report Issue: 1

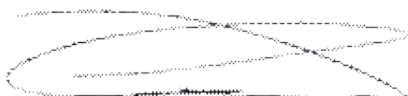

Report Date: 03 August 2023

Survey Date: 20 July 2023 to 21 July 2023

Two storey storage unit	External	Corrugated cement sheets Roof	External	350m ²	Very Low	Remove	Non Licensed Work

NO ACCESS AREAS SPECIFIC TO THIS SITE

Detailed below are specific areas that were inaccessible during the time of the survey, either as agreed prior to commencement or during the survey. All of the following areas should be **presumed to contain asbestos** until future inspections deem otherwise. If during future refurbishment or demolition projects these areas are likely to be disturbed or exposed then a 'Refurbishment' or 'Pre Demolition' survey should be undertaken to highlight possible asbestos containing materials.

Building	Floor	Room	Access Restriction
----------	-------	------	--------------------

There were no inaccessible areas.

2 SURVEY SCOPE

The purpose of the survey was to locate and identify the presence of any asbestos containing materials and ascertain any associated risk within all areas of the premises prior to major refurbishment / demolition works being undertaken to the premises.

The survey was commissioned by Liam Hennessy Clifford Devlin, Clifford House, Hedley Avenue, West Thurrock, Grays, Essex and was conducted by George Ross of Global Environmental on 20 July 2023 to 21 July 2023.

The site comprised of Commercial property

The survey consisted of a Refurbishment survey to the following areas: The Site contains several vacant single storey buildings. 1. A bungalow 2. 5 Sheds – 1 Inaccessible due to recent fire 3. Some sampling from broken cement on floor near fire damaged unit 4. 2 storey storage building (far right of photo)

Building Notes:

Internal notes: N/A

External notes: N/A

3 SURVEY LIMITATIONS

Detailed below are the agreed exclusions to the scope of the survey:

Anything not mentioned in the scope of works.

Any further limitations or inaccessible areas relating to the survey are specified within the Executive Summary

It cannot be guaranteed that all asbestos containing materials have been identified within the site surveyed. This can be due to various reasons, including:

- | MMMF pipework insulation: may have asbestos lining or may cover residue from previously asbestos lagged pipes. It is clearly unreasonable to expect 100% examination. Surveyors will make representative examinations of different types of MMMF insulation but there remains a risk of later discovery during demolition/refurbishment.
- | Concealed voids: again, even using invasive construction techniques, there may be materials hidden within structural elements which will only come to light during the actual demolition process.
- | Access for the survey may be restricted for many reasons beyond our control such as height, inconvenience to others, immovable obstacles or confined space. Such areas will be detailed within the Executive Summary as **Limited Access**.
- | Using standard polarised light microscopy (PLM) as detailed in the Analyst Guide (HSG 248), it may not be possible to identify very fine asbestos fibres such as those present in some textured coatings.
- | Where samples of textured coatings and vinyl floor coverings have been collected, such products may contain a trace quantity of Chrysotile asbestos. Due to this low asbestos content, applications of this product may be non-homogenous and may elicit both positive and negative samples. Where both positive and negative samples are obtained on visually similar products it should be presumed that the products contain Chrysotile throughout even though a "No Asbestos Detected" result has been obtained. This may apply across different properties constructed at the same time.

With regard to the above if during future works any suspect material is discovered that is not detailed in this Report then it is recommended that all work in that area is ceased and a sample of that material is taken for the analysis of its asbestos content.

Where analysis samples of floor coverings has shown there to be an asbestos containing adhesive beneath the vinyl tiles which contains Chrysotile, it can be presumed that this bitumen adhesive is consistent beneath all floor coverings.

4 SURVEYING AND SAMPLING METHOD

A strategy was established to keep the survey in line with the Health and Safety Executive's guidance HSG 264; 'Asbestos: Surveyor Guide', and in accordance with our UKAS accredited in-house procedures. This strategy involved both visual inspection and sample taking techniques. The strategy was formulated from pre planning information from the client and the prevailing site conditions at the time of the survey. These conditions included but were not limited to the building construction, occupancy and overall condition.

Where during the survey inspection materials were suspected of containing asbestos, samples were taken. However, where a large area of visually homogenous material was observed or a number of identical items occurred (e.g. ceiling panels), only a few samples were collected and these were considered to be representative of the whole surface/area.

If on visual inspection materials of the same installation as that of a previously sampled material in another location is observed, then the Surveyor can '**strongly presumed**' that the material has the same asbestos content to that sampled.

In certain cases a sample may not have been taken due to various factors such as height restrictions or hazardous implications. Where applicable, these are in the survey results section as '**presumed**'.

Presumed asbestos containing materials are scored as Crocidolite (3) unless it is known that the product type only ever contained Chrysotile alone.

The sampling method was undertaken in accordance with our UKAS accredited in-house methods and in-line with the Health and Safety Executive Guidance Note HSG248 '*Asbestos: The Analysts' guide for sampling, analysis and clearance procedures.*' These methods were designed to prevent the release of fibre during sampling operations and to ensure that adequate samples were collected. Samples were sealed and double bagged on site. Each bag was labelled with the date, the project reference number and a unique sample number.

Photographs of materials sampled, strongly presumed or presumed were taken at the time of the survey as well as photographs to highlight particular instances such as intrusive inspections. Photographs which are included in this report are not altered by Global Environmental in any way other than to change its orientation or to decrease or increase photo size.

5 BULK ANALYSIS METHOD

Bulk samples are submitted to an independent laboratory from our Approved Supplier List who holds current UKAS accreditation for the analysis of such samples for asbestos content. The analysis of bulk samples is outside the scope of our UKAS accreditation.

Analysis was carried out in accordance with HSG248 'Asbestos: The Analysts' guide for sampling, analysis and clearance procedures.'

Each sample was viewed under a stereo microscope and each different fibre type established. Fibres were then mounted into Refractive Index Liquids and examined using polarised light and dispersion staining techniques to determine asbestos type.

6 MATERIAL RISK ASSESSMENT

Where asbestos had been identified or presumed in a material, an assessment has been made for the potential for fibre release. This material risk assessment is determined by the following algorithm.

Variable	Score	Examples
Project type	1	Asbestos reinforced composite materials (plastics, resins, mastics, felts, bitumen, paints, textured coatings) and asbestos cement.
	2	Asbestos Insulating Board (AIB), gaskets, textiles, ropes, paper
	3	Thermal Insulation (e.g. pipe lagging), sprayed coatings, loose insulation, debris
Surface treatment	0	Reinforced composite materials, encapsulated cement
	1	Enclosed insulation/sprayed coatings, encapsulated AIB, unsealed cement
	2	Unsealed AIB, encapsulated lagging/sprayed coatings/debris
	3	Unsealed lagging/sprayed coatings/debris
Condition	0	No visible damage
	1	Low damage – few scratches, broken edges
	2	Medium damage – significant breakage with areas with potential for loose asbestos fibres
	3	High damage – serious delamination of material with visible asbestos debris
Asbestos type	1	Chrysotile.
	2	Amosite, Tremolite, Actinolite, Anthophyllite
	3	Crocidolite

The Material Risk Score is calculated by summing the above parameters and the potential for fibre release assigned as detailed below.

Material Risk Score	Fibre Release Potential
10 or higher	High
7 – 9	Medium
5 – 6	Low
4 or lower	Very Low

7 GENERAL GUIDANCE

Detailed within Appendix B are the materials sampled during the survey, including the identified or presumed asbestos containing materials. Each area identified gives the location, type of material, sample reference where applicable, condition and a specific recommendation. Additional information regarding the client's duties in undertaking the recommendations is located within this section.

Recommendations are based on all of the information supplied by the client at the time of the survey. As such the minimum requirements to place the asbestos materials in a safe and manageable condition given the current circumstances have been recommended. Should the client have further information on completion of the survey such as proposed refurbishment works or any other projects which are likely to disturb asbestos containing materials then specialist advice should be sought.

Where recommendations have included for certain asbestos containing materials to be considered for encapsulation and or labelling and then to be managed, these recommendations are to ensure the asbestos containing material is easily identifiable and to protect the surface of the material with an elastomeric sealant, which not only affords some impact damage protection and prevents fibre release but also may increase the life span of the material.

All encapsulation or labelling of asbestos containing materials should be carried out under suitably controlled conditions in full accordance with the Control of Asbestos Regulations 2012.

To aid in the management of identified asbestos containing materials they have been a asbestos register for the premises as been provided within Appendix A. This register should be utilised to implement a continuous asbestos management programme whereby the detailed asbestos containing products at this site are periodically inspected for change in condition and where required the appropriate remedial action undertaken.

All asbestos containing composite products (which includes asbestos cement, vinyl tiles, bitumen adhesives etc.) detailed within Appendix B which may require remedial or removal works are currently outside the licensing element of the Control of Asbestos Regulations 2012. Although work on these products does not normally require a contractor to hold a current asbestos removal licence all work must still be carried out in full accordance with these regulations. Work on such materials may be classed as Notifiable Non-Licensed Work (NNLW) or Non-Licensed Work (NLW) within the Executive Summary of this report. Such classifications are given for guidance purposes only based on the condition of the material and the type of substrate it is attached to etc., It is the responsibility of the person responsible for the proposed work to assess whether such work requires notification.

Whether work on asbestos containing composite products will be classed as NNLW or NLW is dependent on the condition of the material and whether its removal will involve significant damage to the material resulting in fibre release. The removal of composite products that are in a good condition and they can be removed relatively intact will normally be classed as NLW. For example, the removal of textured coating to a plasterboard substrate where the plasterboard is to be cut and removed with the textured coating attached would be classed as NLW. However, if the textured coating is to be 'steam stripped' from a ceiling or wall then this will involve significant damage to the material and will be classed as NNLW. Similarly, removal of cement products in good condition and where the removal will involve limited damage to the material will be classed as NLW. However, removal of badly damaged cement products (e.g. fire damaged cement sheets), or where the removal will involve significant damage to the cement product will be classed as NNLW.

All asbestos containing materials used for fire protection and insulating materials (which includes spray coatings, insulation, insulating board, cloth electrical suppressors and boards) detailed within Appendix B, which may require removal or remedial works are covered by the licensing section of the Control of Asbestos Regulations (2012). As such, all works will generally require a formal fourteen day notification to the local enforcing authority prior to undertaking any asbestos abatement projects. In addition to this all removal and remedial works carried out on these materials must only be undertaken by a fully licensed asbestos removal contractor in full accordance with all current and relevant health and safety legislation, approved codes of practice and guidance notes.

The client should be aware that where asbestos containing materials have been given re-inspection intervals they have been recorded within this report an average interval as recommended for asbestos containing materials in a safe and manageable condition given a completed client priority risk assessment.

Where within this report asbestos remediation work has been recommended the inspection interval will only apply on completion of the said works.

The inspection interval may also be subject to change on completion of the priority risk assessments. This is due to high risk areas, which may require a shorter inspection interval and low risk areas which may require a longer inspection interval.

All asbestos waste arising from any remedial or removal works must be disposed of in full accordance with the Hazardous Waste Regulations (2005).

APPENDIX C – Bulk Sample Certificate

CERTIFICATE FOR THE IDENTIFICATION OF ASBESTOS FIBRES

Client Name:	Global Environmental		
Client Address:	11 Bakers Walk, Sawbridgeworth, Herts, CM21 9QE		
Site Address:	The Elms, 371A High Street, Harlington, Hayes, Greater London, UB3 5DQ		
UPRN/Site Ref:	J043984	Date of Analysis:	28 Jul 2023
Attention of:	Michael Gunn	Analysis Report No:	J032082
Surveyor:	N/A	Report Date:	28 Jul 2023
Date Samples Taken:	20 Jul 2023	Analysed By:	Andy Robson
No. of Samples:	12		
Obtained:	Delivered		
Date Samples Recd:	27 Jul 2023		

KEY

N.A.D.I.S = NO ASBESTOS DETECTED IN SAMPLE
CROCIDOLITE = Typically Known as Blue Asbestos (Amphibole Group)
AMOSITE = Typically Known as Brown Asbestos (Amphibole Group)
CHRYSTOTILE = Typically Known as White Asbestos (Serpentine Group)
ANTHOPHYLLITE = Asbestos (Amphibole Group)
ACTINOLITE = Asbestos (Amphibole Group)
TREMOLITE = Asbestos (Amphibole Group)

METHOD

Samples of material thought to contain asbestos are examined in the analytical laboratory, they are examined by eye, followed by more detailed examination using a low powered stereo microscope (X 8 to X 40 magnification), one or more representative sub samples may be prepared mechanically and/or chemically for further examination. Fibres observed in the course of these examinations are categorised tentatively on the basis of morphology and certain physical properties. Each fibre type recognised is sampled by selecting a few fibres or bundles, these are mounted in a refractive index (RI) liquid chosen to match the most likely asbestos type. The fibres are then positively identified as one of the six regulated asbestos types on the basis of their detailed optical properties using polarised light microscopy (PLM) with X 80 upwards magnification, as appropriate to the type of sample.

Samples of material, referenced below, have been examined to determine the presence of asbestos fibres, using AC&MS Ltd "in house" method of transmitted/polarised light microscopy and centre stop dispersion staining, Procedure 05; based on HSE's HSG 248. The sample type described within this bulk certificate is only an opinion & interpretation of AC&MS Ltd, & is outside the scope of our UKAS testing accreditation. If samples have been delivered the site address and actual sample location or sample type is as given by the client at the time of delivery. AC&MS Ltd are not responsible for the accuracy or competence of the sampling by third parties. Under these circumstances AC&MS Ltd cannot be held responsible for the interpretation of the results shown. AC&MS Ltd only takes responsibility of information reported when a staff member of AC&MS Ltd takes the sample(s), using AC&MS Ltd "in house" method of bulk sampling, Procedure 001 based on HSE's HSG 264

Sample Ref	Item Ref	Sample Location / Sample Type	Fibre Type Detected
BS029055	DJ000649	To plasterboard ceiling – Ground Floor, Bedroom 1, Textured coating	CHRYSTOTILE
BS029056	DJ000650	Soffits – External, Front Elevation, Insulating board	AMOSITE
BS029057	DJ000651	Within cavity wall – External, Right Elevation, Upright dpc	CHRYSTOTILE
BS029058	DJ000652	Within switch box – Ground Floor, Pump room, Flash guards	CHRYSTOTILE
BS029059	DJ000653	Roof sheets – External, Externals, Cement	CHRYSTOTILE
BS029060	DJ000654	Scattered sporadically around entire perimeter of single story buildings. – External, Externals, Cement debris	CHRYSTOTILE
BS029061	DJ000655	Within switch box – Ground Floor, Shed 3, Flash guards	CHRYSTOTILE

All samples will be retained in the laboratory for a minimum of 6 Months.

APPENDIX E – Terms & Conditions

Every effort has been made to identify all asbestos materials so far as was reasonably practical to do so within the scope of the survey and the attached report. Methods used to carry out the survey were agreed with the client prior to any works being commenced.

Survey techniques used involves trained and experienced surveyors using the combined approach with regard to visual examination and necessary bulk sampling. It is always possible after a survey that asbestos based materials of one sort or another may remain undetected in the property or area covered by that survey, this could be due to various reasons:

Asbestos materials existing within areas not specifically covered by this report are therefore outside the scope of the survey.

Materials may be hidden or obscured by other items or cover finishes, e.g. over boarding, disguising etc. Where this is the case then its detection will be impaired within a Management Survey.

Asbestos may well be hidden as part of the structure to a building and not visible until the structure is dismantled at a later date.

Debris from previous asbestos removal projects may well be present in some areas; general asbestos debris does not form part of this survey however all good intentions are made for its discovery.

Where an area has been previously stripped of asbestos (e.g. plant rooms, ducts etc) and new coverings added, it must be pointed out that asbestos removal techniques have improved steadily over the years since its introduction. Most notably would be the Control of Asbestos Regulations 2012 or other similar subsequent Regulations laying down certain enforceable guidelines. Asbestos removal prior to this regulation would not be of today's standard and therefore debris may be present below new coverings.

This survey will detail all areas accessed and all samples taken; where an area is not covered by this survey it will be due to no access for one reason or another, e.g. working operatives, sensitive location or just simply no access. It may have been necessary for the limits of the surveyor's authority to be confirmed prior to the survey.

Access for the survey may be restricted for many reasons beyond our control such as height, inconvenience to others, immovable obstacles or confined space. Where electrical equipment is present and presumed in the way of the survey no access will be attempted until proof of its safe state is given. Our operatives have a duty of care under the Health and Safety at Work etc Act 1974 for both themselves and others. Any such areas of no access shall be detailed in the Executive Summary of this report.

In the building where asbestos has been located and it is clear that not all areas have been investigated, any material that is found to be suspicious and not detailed as part of the survey should be treated with caution and sampled accordingly.

Certain materials contain asbestos to varying degrees and some may be less densely contaminated at certain locations (e.g. Artex). Where this is the case the sample taken may not be representative of the whole product throughout. However, all samples are taken in accordance with H.S.E. guidance to minimise such occurrences.

Where a survey is carried out under the guidance of the owner of the property, or his representative, then the survey will be as per his instructions and guidance at that time.

Global Safety & Environmental cannot be held responsible for any damage caused as part of this survey carried out on your behalf. Due to the nature and necessity of sampling for asbestos some damage is unavoidable and will be limited to just that necessary for the taking of the sample.

Global Safety & Environmental shall keep all information gained or acquired in pursuance of the survey in strict confidence. If it is agreed to make any information we have on you public or to a third party then we shall inform you of this in writing prior to the said issue of the information.
