

Tree Report on 38 Bury Street Ruislip Middlesex HA4 7SX

Further to our conversation from our site visit we can confirm the following regards the trees in question.

G1 The row of cypressus trees

T1 The Yew Tree (taxus baccata)

The proposed base for the new structure in proximity to the trees and the environmental impact on the trees adjacent to the proposed footings.

I can see no detrimental impact this will cause to the crown or the root systems of either G1 or T1.

We would advise some minor crown raising of T1 (3 small branches only 4cm in diameter at source) to contain growth back from the apex of the new structure.

From the plans you provided the footings of the structure do not have to be a certain depth. As you plan to raise the footings rather than excavating down around the tree roots there should be no potential issue with as the proposed works will not be invasive to the root system. There is adequate porous ground around the root systems to draw substantial amounts of groundwater to enable the trees to continue to thrive alongside the new structure.

It is my view that minimal tree work is needed to be undertaken and the environmental impact (providing the work is carried out as you described) to G1 and T1 is very low.

Please contact us if we can be of any further assistance to you in this process.

Kindest regards

Tom Addis
