

Abstract The purpose of this study was to determine whether there were differences in the prevalence of self-reported depression between men and women who had been exposed to violence during childhood and adulthood. Data from the National Longitudinal Study of Adolescent Health (*N = 9,800*) are presented. Results indicate that exposure to violence during childhood and adulthood was associated with increased risk of self-reported depression. Furthermore, there were no significant differences in the prevalence of self-reported depression between men and women who had been exposed to violence during childhood and adulthood.
