## **Limitations**

Syntegra Consulting Ltd ("SC") has prepared this Report for the sole use of **Mr. Jag Singh** in accordance with the Agreement under which our services were performed. No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by SC. This Report is confidential and may not be disclosed by the Client or relied upon by any other party without the prior and express written agreement of SC.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate. Information obtained by SC has not been independently verified by SC, unless otherwise stated in the Report.

The methodology adopted and the sources of information used by SC in providing its services are outlined in this Report. The work described in this Report was undertaken in **May 2014** and is based on the conditions encountered and the information available during the stated period of time. The scope of this Report and the services are accordingly factually limited by these circumstances.

This renewable report and SBEM/SAP pre-assessment modelling were generated based on the provided drawings and building information assumptions. Although every effort has been made to provide accurate content within this report, SC makes no warranty or assumes no legal liability or responsibility for the accuracy or completeness of information contained in this report.

SC also wishes to make aware that this document is guidance only on energy strategy and should not be seen as a building design document. It is the responsibility of the APPOINTED BUILDING SERVICES / Design Team to develop, select and implement appropriate energy efficiency measures to ensure compliance.

Where assessments of works or costs identified in this Report are made, such assessments are based upon the information available at the time and where appropriate are subject to further investigations or information which may become available.

SC disclaim any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to SC's attention after the date of the Report.

Certain statements made in the Report that are not historical facts may constitute estimates, projections or other forward-looking statements and even though they are based on reasonable assumptions as of the date of the Report, such forward-looking statements by their nature involve risks and uncertainties that could cause actual results to differ materially from the results predicted. SC specifically does not guarantee or warrant any estimate or projections contained in this Report.

Costs may vary outside the ranges quoted. Whilst cost estimates are provided for individual issues in this Report these are based upon information at the time which can be incomplete. Cost estimates for such issues may therefore vary from those provided. Where costs are supplied, these estimates should be considered in aggregate only. No reliance should be made in relation to any division of aggregate costs, including in relation to any issue, site or other subdivision.

No allowance has been made for changes in prices or exchange rates or changes in any other conditions which may result in price fluctuations in the future. Where assessments of works or costs necessary to achieve compliance have been made, these are based upon measures which, in SC's experience, could normally be negotiated with the relevant authorities under present legislation and enforcement practice, assuming a pro-active and reasonable approach by site management.

Forecast cost estimates do not include such costs associated with any negotiations, appeals or other non-technical actions associated with the agreement on measures to meet the requirements of the authorities, nor are potential business loss and interruption costs considered that may be incurred as part of any technical measures.

## **Copyright**

## 1. Executive Summary

The design of the proposed mixed use development in **2 Midcroft**, which is a 5-storey development located in an urban residential area in Ruislip and will contain **14No. Residential units and 2No. Commercial Units**, has incorporated building fabric enhancement (above current building regs requirements) to increase the energy efficiency of the building. This includes that the development uses less energy, by adopting sustainable design and construction measures and by supplying energy efficiently.

Given the complexity of calculating and assessing CO<sub>2</sub> emissions, the **London Borough of Hillingdon** requires all proposed developments to be designed and built to minimise greenhouse gas emissions across their lifetime and incorporate sustainable design and construction measures. The Council will promote and measure sustainable design and construction by expecting new residential units to meet **Code for Sustainable Homes 'Level 4' along with an achievement of 20% onsite renewable energy generation for the whole development**, in accordance with the 'Local Plan: Part 1 – Strategic Policies (Adopted November 2012) - Policy BE1: Built Environment' and the Mayor's targets.

The recommendation for the proposed mixed use development is for a total of **19.619 kWp PV**, which **equals to 60 PV panels in total (53PV panels for the residential units and 7 PV panels for the commercial units) and approximately 98 m<sup>2</sup> required roof area in total** along with **efficient Individual Combi Gas Boilers (89% efficiency) for the residential units and regular condensing gas boilers for the Commercial units**. This is based on the following reasons:

1. (Residential) The strategy would provide an average of **43.7% CO<sub>2</sub> reduction saving (DER/TER) against current building regulations for the development. Therefore, the strategy meets BRUK-L1A 2013 requirements for the development.**
2. (Residential) A separate CSH pre-assessment has been undertaken for the residential units of the development. **The CSH pre-assessment demonstrates that a "Code level 4" rating can be achieved for all dwellings.**
3. (Residential) After the application of the Energy Hierarchy, the regulated carbon dioxide emissions are presented on the table below:

	<b>Carbon Dioxide emissions (Tonnes CO<sub>2</sub> per annum)</b>
	<b>Regulated</b>
<b>Baseline: Building Regulations 2010 Part L Compliant Development</b>	1.249

After energy demand reduction	1.258
After CHP/ Communal Heating	1.258
After renewable energy	0.703

The chart below summarizes the regulated carbon dioxide savings from each stage of the Energy Hierarchy:

Regulated Carbon Dioxide savings		
	(Tonnes CO <sub>2</sub> per annum)	(%)
<b>Savings from energy demand reduction</b>	-0.009	-0.01%
<b>Savings from CHP/ Communal Heating</b>	0	0%
<b>Savings from Renewable energy</b>	0.555	44.1%
<b>Total Cumulative Savings</b>	<b>0.546</b>	<b>43.7%</b>
<b>Total Target Savings</b>	<b>0.500</b>	<b>40%</b>
<b>Annual Surplus</b>	<b>0.046</b>	

4. (Commercial) The strategy would provide a **42.7% CO<sub>2</sub> reduction saving (BER/TER)** against current building regulations for the development. Therefore, the strategy meets **BRUK-L2A 2013** requirements for the development.
5. (Commercial & Residential) The strategy would provide an average of **36.8% reduction of CO<sub>2</sub> emissions the energy demand via onsite renewable technology (PV)** for the whole development.
6. **Note:** According to the Hillingdon Council's DRAFT Local Plan: PART 2 Development Management Policies - Policy DME1: Sustainable Design Standards, a BREEAM pre-assessment targeting a 'Very Good' rating is required for all new non-residential developments to support the planning application. However, since the proposed commercial units are below 100m<sup>2</sup>, these are considered to be classified under small developments and hence a separate BREEAM pre-assessment has not been undertaken.

## 2. Introduction

Syntegra Consulting Ltd has been appointed as energy consultants to produce an energy strategy for the '**Development consisting of 14No. Residential units and 2No. Commercial Units**' for the scheme at **2 Midcroft, Ruislip, HA4 8ES** – to support the scheme design process, demonstrate Building regulations Part L 2013 compliance, intent to design to target Code Level 4 standard for the flats and intent to target a 20% reduction of CO<sub>2</sub> emissions reduction via onsite renewable energy technology for the overall development in accordance with planning policy requirements.

This report will outline the following:

- 1) This report will assess the proposed development site's estimated energy demand & CO<sub>2</sub> emissions. It will look into the feasibility of Low Zero Carbon technologies, examining the following aspects relative to LZC/renewable technologies:
  - Energy generated by Renewable/Low Zero Carbon Technologies (LZC)
  - Feasibility assessment for each Renewable/Low Zero Carbon Technologies (LZC)
  - Local Planning Requirements
  - Life cycle Costs & payback period for the technology investment
  - Available Grants
- 2) (Residential) -The Code for Sustainable Homes (CSH) pre-assessment strategy (under the current CSH Nov 2010 guide) in terms of the intent in achieving the **overall minimum Code Level 4** strategy for the development. –In accordance with the London Plan 2011 and local planning policy targets.
- 3) (Residential) -The proposed building fabric and Low Zero Carbon (LZC) design strategy and analysis calculations, with respect to the Standard Assessment energy assessment Procedure (SAP). Demonstration of how the design is compliant against the current 2013 Part L1A buildings regulations i.e **A 40% DER/TER CO<sub>2</sub> emission reduction against BRUKL Part L1A 2013**, as required to achieve code level 4 for the ENE1 category of the code for sustainable homes assessment – In accordance with the London Plan 2011 and local planning policy targets.
- 4) (Commercial) -The comparison of the development's energy consumption against the notional building model in order to show a minimum target for the overall development of **40% DER/TER CO<sub>2</sub> emission reduction against current 2013 Part L2A building regulations**.
- 5) (Residential & Commercial) - The target of **at least 20% reduction of the development's CO<sub>2</sub> Emissions** through the utilisation of renewable technology as per the planning policy requirements.

## 2.1 Site Description

The proposed development comprises of a five storey mixed use development. The development comprises of 14No. New Residential Units and 2No. Commercial Units. The development is located in the urban area of Ruislip in London. The development is in close proximity to Ruislip Underground station (approx 0.3 miles). The site is within the London Borough of Hillingdon.

## 2.2 Policy documents

### National Planning Policy Framework (March 2012)

The National Planning Policy Framework is a key part of our reforms to make the planning system less complex and more accessible, to protect the environment and to promote sustainable growth.

### London Borough of Hillingdon

### A Vision for 2026 – Local Plan: Part 1 – Strategic Policies (Adopted November 2012)

#### Policy BE1: Built Environment

The Council will require all new development to improve and maintain the quality of the built environment in order to create successful and sustainable neighbourhoods, where people enjoy living and working and that serve the long-term needs of all residents. All new developments should:

- Maximise the opportunities for all new homes to contribute to tackling and adapting to climate change and reducing emissions of local air quality pollutants.
- The Council will require all new development to achieve reductions in carbon dioxide emission in line with the London Plan targets through energy efficient design and effective use of low and zero carbon technologies. Where the required reduction from on-site renewable energy is not feasible within major developments, contributions off-site will be sought.
- The Council will seek to merge a suite of sustainable design goals, such as the use of SUDS, water efficiency, lifetime homes, and energy efficiency into a requirement measured against the Code for Sustainable Homes and BREEAM. These will be set out within the Hillingdon Local Plan: Part 2- Development Management Policies Local Development Document (LDD).
- All developments should be designed to make the most efficient use of natural resources whilst safeguarding historic assets, their settings and local amenity and include sustainable

design and construction techniques to increase the re-use and recycling of construction, demolition and excavation waste and reduce the amount disposed to landfill;

The above policy re-iterates the 20% reduction of carbon dioxide emissions through onsite renewable energy generation in line with the Mayor's targets. It also specifies for new residential developments to achieve Code for Sustainable Homes Level 4 in line with the London Plan.

**The London Plan Renewable Energy Policy 2011(Policy 5.2, 5.6 & 5.7)**

The Mayor will and boroughs should in their DPDs adopt a presumption that developments will achieve a reduction in carbon dioxide emissions of 20% from onsite renewable energy generation according to 5.42 section of Policy 5.7 Renewable Energy (which can include sources of decentralised renewable energy). According to Policy 5.2 (clause B) all residential and non-residential buildings should show an improvement of 40% BER/TER from 2013 to 2016, unless it can be demonstrated that such provision is not feasible. Furthermore, intent must be shown for connecting to a Decentralised energy Network according to Policy 5.6 and utilizing a Combined Heat & Power.

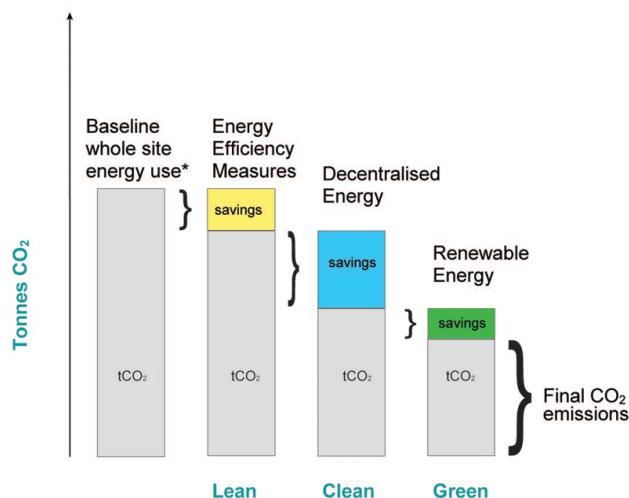

## 2.3 The Energy Hierarchy

The Mayor's Energy Strategy adopts a set of principles to guide design development and decisions regarding energy, balanced with the need to optimise environmental and economic benefits. These guiding principles have been reordered since the publication of the Mayor's Energy Strategy in Feb 2004 and the recently adopted replacement London Plan 2011 states that 'The following hierarchy should be used to assess applications:

- *Using less energy, in particular by adopting sustainable design and construction measures;*
- *Supplying energy efficiency, in particular by prioritising decentralised energy generation; and*
- *Using renewable energy.*

The development Energy strategy has adopted the following design ethos:

- **BE LEAN** – By using less energy and taking into account the further energy efficiency measure in comparison to the baseline building.
- **BE CLEAN** – By supplying energy efficiently. The clean building looks at further carbon dioxide emission savings over the lean building by taking into consideration the use of decentralise energy via CHP.
- **BE GREEN** – By integrating renewable energy into the scheme which can further reduce the carbon dioxide emission rate.

### 3. The Development configuration scheme:

The proposed development scheme consists of the following characteristics:

#### 3.1 The Unit configuration

The following table presents the type, area and number of units to be assessed within this report:

##### Proposed units to be assessed for the development

###### Residential

No. of Units	Type of Unit	Floor	Number of bedrooms	Individual Dwelling Area m <sup>2</sup>
1	Flat	1st	2	86.8
2	Flat	1st	Studio	47.6
3	Flat	1st	2	73.7
4	Flat	1st	2	73.7
5	Flat	1st	2	76.1
6	Flat	2nd	2	86.8
7	Flat	2nd	Studio	47.6
8	Flat	2nd	2	73.7
9	Flat	2nd	2	73.7
10	Flat	2nd	2	76.1
11	Flat	3rd	2	86.8
12	Flat	3rd	Studio	47.6
13	Flat	3rd	2	73.7
14	Flat	3rd	2	73.7
<b>Total</b>	-	-	<b>25</b>	<b>997.6</b>

Table 1

###### Commercial

Type of Unit	No. of Units	Number of bedrooms	Individual Unit Area m <sup>2</sup>
Commercial Unit 1	1	-	57.6
Commercial Unit 2	1	-	63.7
<b>Total</b>	<b>2</b>	-	<b>121.3</b>

Table 2

### 3.2 Specification of Building Materials

The table presented below demonstrates the material properties of the building fabric that have been proposed:

#### Residential Envelope Specification

Building Element	Proposed Specification
External Walls U-value	0.18
Window units (whole window) U-value	1.4 double glazing
Floor U-value	-
Roof U-value	0.12
Air Permeability $\text{m}^3/(\text{h} \cdot \text{m}^2)$ at 50 Pa	4
Low Energy Lighting	100%

Table 3

#### Commercial Envelope Specification

Building Element	Proposed Specification
External Walls U-value	0.18
Window units (whole window) U-value	1.4 double glazing
Floor U-value	0.13
Air Permeability $\text{m}^3/(\text{h} \cdot \text{m}^2)$ at 50 Pa	5
Low Energy Lighting	100%

Table 4

### 3.3 Fuel

The assessment has assumed the following fuel carbon emissions factors - The fuel carbon emissions factors used are in accordance with **SBEM (for Building Regs Part L2A 2013) and SAP 2009 (for Building Regs Part L1A 2013)**.

Carbon Emissions Factor	SAP 2013 kgCO2/kW
Grid Electricity	0.445
Coal (traditional British Coal)	0.313
Heating Oil	0.245
LPG	0.214
Natural Gas	0.184
Wood Pellets	0
Bio Diesel	0.245
Petrol	0.234

Table 5

#### 4. Baseline CO<sub>2</sub> Emissions

The baseline energy use and resulting CO<sub>2</sub> emissions rates of the development have been assessed using the Design Builder/SBEM 2009 approved software (SBEM 2012 software is currently under revision and it will be realised soon) and SAP 2012 Government approved software.

The SBEM 2009 and SAP 2012 calculations have been produced according to the ADL1A & ADL2A 2013 building regulation requirements.

For the purpose of this report the baseline energy use and CO<sub>2</sub> emissions for the residential and the commercial parts of the development are calculated based on the minimum requirements specified in the Building Regulations ADL1A & L2A 2013 document (Table 6).

	ADL1A 2013 min. required values (Residential)	ADL2A 2013 min. required values (Commercial)	Proposed building values (Residential)	Proposed building values (Commercial)
Air Permeability m <sup>3</sup> /(h.m <sup>2</sup> ) at 50 Pa	5	3	4	5
Wall U value W/m <sup>2</sup> C <sup>0</sup>	0.18	0.26	0.18	0.18
Roof U value W/m <sup>2</sup> C <sup>0</sup>	0.13	0.18	0.12	-
Floor U value W/m <sup>2</sup> C <sup>0</sup>	0.13	0.22	-	0.13
Window U value W/m <sup>2</sup> C <sup>0</sup>	1.4	1.6	1.4	1.4

Table 6

The baseline average energy use and CO<sub>2</sub> emissions for the development are presented in the tables below:

- **Residential**

Building Services	Baseline CO <sub>2</sub> Emissions (kg CO <sub>2</sub> /m <sup>2</sup> /yr)
Heating	7.86
Auxiliary	0.57
Lighting	2.30
Hot Water	6.99
<b>Total regulated emissions</b>	<b>17.72</b>

Building Services	Baseline CO <sub>2</sub> Emissions (kg CO <sub>2</sub> /m <sup>2</sup> /yr)	Baseline CO <sub>2</sub> Emissions (Tonnes CO <sub>2</sub> / yr)
<b>Total regulated emissions (heating, hot water, lighting, fans &amp; pumps)</b>	<b>17.72</b>	<b>1.249</b>

- **Commercial**

Building Services	Baseline Building CO <sub>2</sub> Emissions (kg of CO <sub>2</sub> /m <sup>2</sup> /yr)
<b>Regulated Emissions</b>	<b>37.2</b>

## 5. BE LEAN – Energy Efficient Design

This section outlines the design energy efficient measures taken in order to minimise the building's energy demand and therefore reduce energy use and CO<sub>2</sub> emissions further than the Baseline (Building Regulations 2013 Part L compliance).

The energy efficient measures include:

- i) Inclusion of better U-values than the minimum U-values set in the ADL1A & L2A 2013 document.
- ii) Designing for a buildings air permeability exceeding ADL1A & 2A 2013 target values.
- iii) Utilising the highly efficient heating and hot water systems.
- iv) Utilising low energy efficient lighting such as LED lighting.

### Heating Demand

The heating energy demand will be reduced by providing good insulation of the building envelope in order to minimise heat losses.

- **Residential**

At the 'BE LEAN' stage High Efficiency Combi Gas Boilers have been examined for the heating and hot water demand. This strategy utilizes Individual combi boilers in each dwelling to provide heating and DHWS - (89% efficiency).

- **Commercial**

At the 'BE LEAN' stage High Efficiency Regular Condensing Gas Boilers have been examined for the heating and hot water demand. This strategy utilizes regular gas boiler in each unit along with a hot water cylinder to provide heating and DHWS - (89% efficiency).

### Ventilation

A natural supply ventilation strategy will be adopted in all dwellings with extract fans in bathrooms and kitchens. Therefore, higher energy consumption and CO<sub>2</sub> emissions due to mechanical ventilation is avoided

### Lighting

The proposed light fittings will be low energy efficient fittings. These can be T5 fluorescent fittings with high frequency ballasts, or LED fittings.

The following tables demonstrate the reduction in CO<sub>2</sub> emissions caused by the energy efficiency measures mentioned above.

- Residential

### Combi gas boilers BE LEAN stage

Building Services	Baseline CO <sub>2</sub> Emissions (kg CO <sub>2</sub> /m <sup>2</sup> /yr)	BE LEAN Building CO <sub>2</sub> Emissions (kg CO <sub>2</sub> /m <sup>2</sup> /yr)
Heating	7.86	7.92
Auxiliary	0.57	0.57
Lighting	2.30	2.30
Hot Water	6.99	7.04
<b>Total regulated emissions</b>	<b>17.72</b>	<b>17.82</b>

#### CO<sub>2</sub> Reductions after BE LEAN stage

Regulated Emissions	Baseline CO <sub>2</sub> Emissions	BE LEAN Building CO <sub>2</sub> Emissions	% reduction in CO <sub>2</sub> Emissions
kgr of CO <sub>2</sub> /m <sup>2</sup> /yr	17.72	17.82	
Tonnes CO <sub>2</sub> / yr	1.249	1.258	-0.01%

From the table above it can be seen that the overall CO<sub>2</sub> reduction due to energy efficiency is **-0.01%** for the total emissions.

- Commercial

	Baseline CO <sub>2</sub> Emissions (kgr of CO <sub>2</sub> /m <sup>2</sup> /yr)	BE LEAN Building CO <sub>2</sub> Emissions (kgr of CO <sub>2</sub> /m <sup>2</sup> /yr)	% reduction in CO <sub>2</sub> Emissions
Regulated Emissions (average weighted)	37.2	30.15	19.0%

From the table above it can be seen that the average CO<sub>2</sub> reduction due to improved U-values is **19.0%** for the total emissions.

## 6. BE CLEAN – CHP & DECENTRALISED ENERGY NETWORKS

The energy hierarchy encourages the use of a CHP system and the connection to District Heating system to reduce CO<sub>2</sub> emissions further.

### CHP

The Energy Hierarchy identifies combined heat and power (CHP) as a method of producing heat and electricity with much lower emissions than separate heat and power. Also, it encourages the creation of district heating systems supplied by CHP.

The implementation of a CHP strategy should be decided according to good practice design. Key factors for the efficient implementation of the CHP system are:

- Development with high heating load for the majority of the year.
- CHP operation based on maximum heat load for minimum 10 hours per day.
- CHP operation at maximum capacity of 90% of its operating period.

A CHP system will not be considered for this development due to the following reasons:

- The heating load of the building is not enough for the CHP system to run efficiently.
- Economic viability is heavily dependent on the demand for heat and power, as well as the price of electricity and gas. The heat and power demand of the proposed development is not sufficient for a CHP system to run efficiently

Hence, the implementation of a CHP strategy is not recommended for this development.

### Micro - CHP

Micro CHP has not been considered further for this project for the following reasons:

Micro-CHP is a relatively new concept (Baxi Ecogen was made available in 2009) and issues are raised in relation to unproven technology, inefficiency for shorter run cycles and lack of technical knowledge that can limit the practical application of micro CHP at present. In addition other issues surrounding the fact that around 50% of electricity generated in domestic properties is surplus, high installation costs and estimated low life expectancy has also been taken into consideration as to its Commercial units un-viability for this development scheme. Micro-CHP also has lower FIT tariff rate and period duration and is only applicable for systems under 2kW.

### Decentralised Energy Network

The feasibility of connecting into an existing heating network or providing the building with its own combined heat and power plant has been assessed alongside the **London Heat Map Study For London Borough of Hillingdon (January 2011)** as part of this assessment. The study does not identify the area in 2 Midcroft as a high potential area for a District Heating network. The development is not in close proximity to an existing District Heating transmission line. At the moment there is no decentralized energy network available and in particular a district heating network in the proximity of the proposed development site that would allow the development to connect to such a network. This

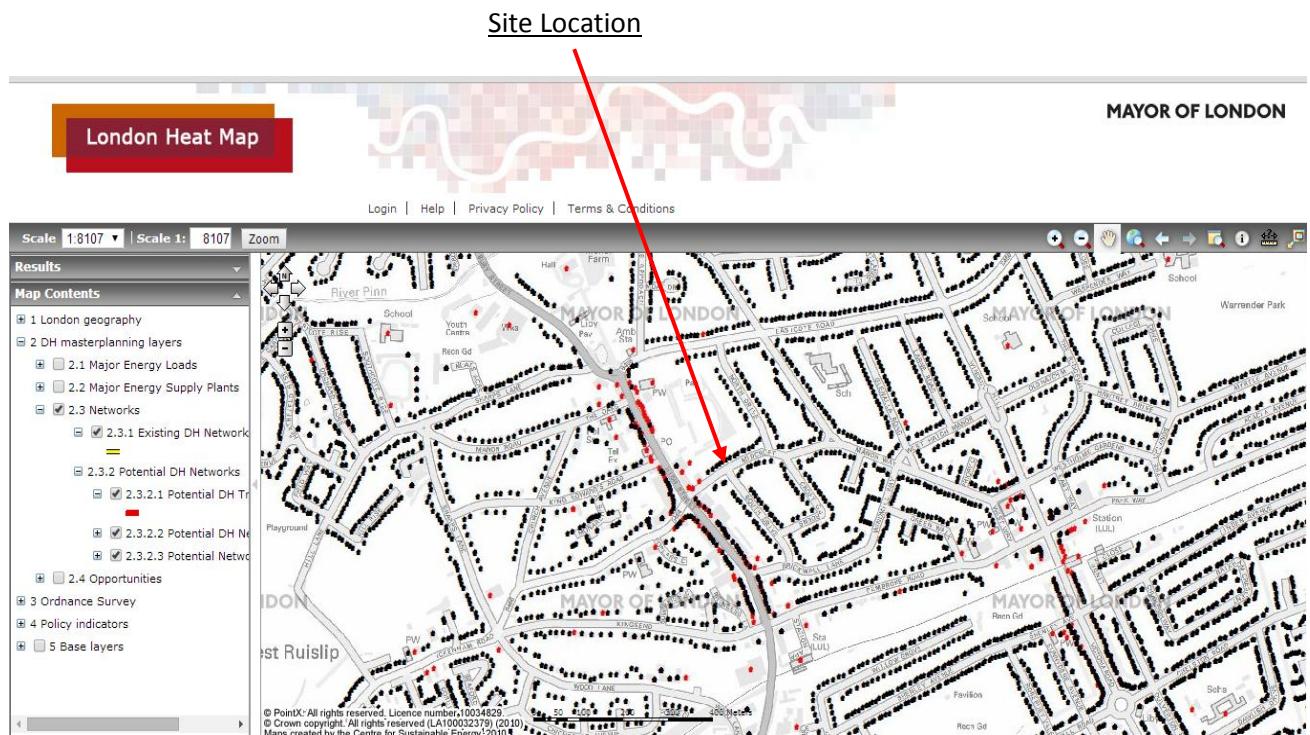

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
Registered Company No. 06408056

T: 08450091625  
VAT Registration No. 98001604

E: [mail@syntegra-epc.co.uk](mailto:mail@syntegra-epc.co.uk)

is demonstrated clearly from the London Heat Map (<http://www.londonheatmap.org.uk>) snapshot below.

**The Mayor's Energy Strategy** favours community heating systems because they offer:

- Potential economies of scale in respect of efficiency and therefore reduced carbon emissions; and
- Greater potential for future replacement with Low or Zero Carbon (LZC) technologies.

The option of installing **Communal Gas Boilers with 95% efficiency** has been examined. This strategy utilizes a communal boiler system to provide heating and DHWS to all dwellings via a Heat Interface Unit (HIU) installed in each dwelling. It also has the flexibility to allow for future connections to a District heating system via plate heat exchangers.

## Communal gas boilers BE CLEAN stage

Building Services	BE LEAN CO <sub>2</sub> Emissions (kg CO <sub>2</sub> /m <sup>2</sup> /yr)	BE CLEAN Building CO <sub>2</sub> Emissions (kg CO <sub>2</sub> /m <sup>2</sup> /yr)
Heating + Hot Water	14.96	13.86
Auxiliary	0.57	0
Lighting	2.30	2.30
<b>Total regulated emissions</b>	<b>17.82</b>	<b>16.16</b>

### CO<sub>2</sub> Reductions after BE CLEAN stage

Regulated Emissions	BE LEAN Building CO <sub>2</sub> Emissions	BE CLEAN Building CO <sub>2</sub> Emissions	% reduction in CO <sub>2</sub> Emissions
kgr of CO <sub>2</sub> /m <sup>2</sup> /yr	17.82	16.16	
Tonnes CO <sub>2</sub> / yr	1.258	1.141	0.09%

From the table above it can be seen that the overall CO<sub>2</sub> reduction due to energy efficiency is 0.09% for the total emissions.

- Commercial

### CO<sub>2</sub> Reductions after BE CLEAN stage

	BE LEAN CO <sub>2</sub> Emissions (kgr of CO <sub>2</sub> /m <sup>2</sup> /yr)	BE CLEAN Building CO <sub>2</sub> Emissions (kgr of CO <sub>2</sub> /m <sup>2</sup> /yr)	% reduction in CO <sub>2</sub> Emissions
Regulated Emissions	30.15	30.15	0%

From the table above it can be seen that the average CO<sub>2</sub> reduction due to improved U-values is 0% for the total emissions.

## 7. BE GREEN – RENEWABLE ENERGY

In this section the viable renewable energy technologies that will reduce the development's CO<sub>2</sub> emissions further by 20% are examined. Incorporating lean design measures will significantly reduce the onsite energy consumption and the CO<sub>2</sub> emissions of the building however the reduction in emissions is still short of the target set out in the 'London Plan'. The 'London Plan' also states that a further CO<sub>2</sub> reduction of 20% must be achieved by the installation of renewable technologies. Below is a review of possible renewable technologies for incorporation in the proposed development.

All of the LZC technologies are assessed against a number of criteria. Hence, LZC technology feasibility will be assessed according to the following criteria:

- I. Renewable energy resource or fuel availability of the LZC technology on the site.
- II. Space limitations due to building design and urban location of the site.
- III. Capital, operating and maintenance cost.
- IV. Planning Permission
- V. Implementation with regards the overall M&E design strategy for building type

The renewable/LZC technologies which were found **non feasible** based on the above criteria are the following:

- Wind Turbines [See Appendix Section 10.1]
- Biomass Boilers [See Appendix Section 10.2]
- Hydrogen Fuel Cells [See Appendix Section 10.3]
- Small scale hydro power [See Appendix Section 10.4]
- Grd. Source Heat Pump (GSHP) [See Appendix Section 10.5]
- CHP & Micro CHP [See Appendix Section 10.6]
- Solar Thermal

### 7.1 PHOTOVOLTAIC (PV) – PROPOSED TECHNOLOGY

PV is the proposed renewable technology for this development. The PV system will provide self-generating electricity which can be sold back to the grid. The CO<sub>2</sub> reduction via renewables target is achieved with the implementation of PV. For the calculation of the payback period, the Feed-In-Tariffs' (FITs) has been taken into account. The PV load falls within the bracket associated with a FIT tariff applied of 12.13 p per kWh for electricity generated and 4.77 p per kWh for electricity exported back to the grid (over 20 years).

## PV System specification

- **Residential**

The PV system capacity for the residential part of the development depends upon the selection of the two heating systems outlined at the 'BE LEAN' and at the 'BE CLEAN' stage of the energy hierarchy.

Therefore, the amount of PV's relating to each of the heating system options is outlined below.

- **Option 1 : Individual combi gas boilers + 17.33kWp PV**

The tables below illustrate the site and the PV panels details:

<b>Orientation</b>	South
<b>Panel Tilt</b>	30°
<b>Overshading</b>	Less than 20 percent
<b>Proportion Exported</b>	50%
<b>Build Type</b>	New
<b>Energy Efficiency</b>	EPC valid and at least Band D or higher
<b>Installation Type</b>	Not a multi-installation

<b>Number of Panels</b>	53
<b>Manufacturer</b>	Sunpower
<b>Model</b>	SPR 327NE WHT D
<b>Type</b>	Monocrystalline
<b>Area</b>	1.631 m <sup>2</sup>
<b>Power Output</b>	327 Wp

<b>System Specification :</b>	<b>17.33 kWp</b>
<b>Total Roof Area Required :</b>	<b>86.4 m<sup>2</sup></b>
<b>Annual Electricity Output :</b>	<b>14967.3 kWh</b>

This table above shows that the proposed PV specification for the residential units. It will generate 14967.3 kWh per year. For the 17.33 kWp system, 53 high efficiency 327W monocrystalline PV panels need to be installed. The roof area required for the PV panels is approximately 86.4m<sup>2</sup>.

### 17.33 kWp Solar PV for ROI model below

**Note: PV panels are based on high output, high efficiency at 327 Watts/panel.**

<b>Investment in 17.39kWp System: *</b>	£ 23,359.52
<b>First Year:</b>	
Income from Feed-In Generation Tariff @ 12.13p/kWh:	£ 1,752.67
Income from exporting energy @ 4.77p/kWh:	£ 344.61
Electricity Saving:	£ 1,040.33
Total Benefit:	£ 3,137.61
<b>Payback Time:</b>	6y 7m
<b>Total Profit Over 20 years:</b>	<b>£ 68,505.47</b> <b>14.66 % per year</b> <b>(6.85% AER)</b>

#### Assumptions:

- Illustrative solar PV performance figures only. Figures are given in good faith but do not constitute "Financial Advice".
- Exact PV subsidy figures may depend on grants available at particular locations and other factors.
- Your property has an Energy Performance Certificate (EPC) rating of level D or better.
- Yearly PV output uses a factored degradation over time based on industry estimates.
- Tariffs shown presume installation after the new FiT rates
- VAT is included (at 5% where appropriate) unless a new build is specified.
- Photovoltaic Panels will not be shaded (e.g. by Trees or Buildings) as shading affects PV output.
- Exact equipment costs are estimated based on retail prices in 2012 and will vary by installer/supplier.
- Installation costs are based on industry averages for installation type/size. Every install is different and you should obtain 3 quotes.
- Assuming that you pay 14.4p per unit and that around 35% of the solar electricity that you generate will be used in your home, having an export meter (you can change such assumptions above).

In order to qualify both the installer and the equipment must be certified under the Microgeneration Certification Scheme (MCS).

PV plant location(s) – To be located on the flat roof.

### CO<sub>2</sub> Emissions Reduction by PV

The table below demonstrate the results of the CO<sub>2</sub> emissions and energy use after the implementation of the PV technology.

The following tables demonstrate the reductions achieved by PV technology for the proposed heating options:

- Residential

### Option 1: Combi gas boilers + 17.33kWp PV BE GREEN stage

Building Services	BE LEAN CO <sub>2</sub> Emissions (kg of CO <sub>2</sub> /m <sup>2</sup> /yr)	BE GREEN Building CO <sub>2</sub> Emissions (kg of CO <sub>2</sub> /m <sup>2</sup> /yr)
Heating	7.92	7.92
Auxiliary	0.57	0.57
Lighting	2.30	2.30
Hot Water	7.04	7.04
Energy generated by renewables	-	<b>-7.94</b>
<b>Total (regulated)</b>	<b>17.82</b>	<b>9.88</b>

### CO<sub>2</sub> Reductions after BE GREEN stage

Regulated Emissions	BE LEAN Building CO <sub>2</sub> Emissions	BE GREEN Building CO <sub>2</sub> Emissions	% reduction in CO <sub>2</sub> Emissions
kgr of CO <sub>2</sub> /m <sup>2</sup> /yr	17.82	9.88	
Tonnes CO <sub>2</sub> / yr	1.258	0.703	44.1%

From the table above it can be seen that the overall CO<sub>2</sub> reduction due to energy efficiency is **44.1%** for the total emissions.

## Option 2: Communal gas boilers + 13.08kWp PV BE GREEN stage

Building Services	BE CLEAN CO <sub>2</sub> Emissions (kg of CO <sub>2</sub> /m <sup>2</sup> /yr)	BE GREEN Building CO <sub>2</sub> Emissions (kg of CO <sub>2</sub> /m <sup>2</sup> /yr)
Heating + Hot Water	13.86	13.86
Auxiliary	0	0
Lighting	2.30	2.30
Energy generated by renewables	-	-5.93
<b>Total (regulated)</b>	<b>16.16</b>	<b>10.23</b>

### CO<sub>2</sub> Reductions after BE GREEN stage

Regulated Emissions	BE CLEAN Building CO <sub>2</sub> Emissions	BE GREEN Building CO <sub>2</sub> Emissions	% reduction in CO <sub>2</sub> Emissions
kgr of CO <sub>2</sub> /m <sup>2</sup> /yr	16.16	10.23	
Tonnes CO <sub>2</sub> / yr	1.141	0.723	36.6%

From the table above it can be seen that the overall CO<sub>2</sub> reduction due to energy efficiency is **36.6%** for the total emissions.

- Commercial units

### CO<sub>2</sub> Reductions after BE GREEN stage (2.289kWp)

Regulated Emissions	BE CLEAN CO <sub>2</sub> Emissions (kgr of CO <sub>2</sub> /m <sup>2</sup> /yr)	BE GREEN CO <sub>2</sub> Emissions (kgr of CO <sub>2</sub> /m <sup>2</sup> /yr)	% reduction in CO <sub>2</sub> Emissions
(average weighted)	30.15	21.3	29.4%

From the table above it can be seen that the average weighted CO<sub>2</sub> reductions from all the proposed units due to improved U-values are **29.4%** for the total emissions.

## 8. Conclusion

Due to the site spatial limitations, location and the other issues identified previously in the report technologies such as Ground Source Heat Pump, Biomass, Solar Thermal, Hydroelectricity and Wind turbines are immediately unfeasible. The design has incorporated building fabric enhancement (above current building regs requirements) to increase the energy efficiency of the building.

The recommendation for the proposed mixed use development at **2 Midcroft, Ruislip, HA4 8ES** is for a total of **19.619 kWp PV, which equals to 60 PV panels in total (53PV panels for the residential units and 7 PV panels for the commercial units) and approximately 98 m<sup>2</sup> required roof area in total** along with **efficient Individual Combi Gas Boilers for the residential units and regular condensing gas boilers for the Commercial units**. This is based on the following reasons:

1. PV plant location(s) – The plant would be located on the flat roof. The PV panels are based on high output, high efficiency Sunpower 327 watts. PV layouts and allocation of roof areas are yet to be finalised.
2. (Residential) The strategy would provide an average of **43.7% CO<sub>2</sub> reduction saving (DER/TER) against current building regulations for the development. Therefore, the strategy meets BRUK-L1A 2013 requirements for the development.**
3. (Residential) The strategy would provide an average Fabric Energy Efficiency of **39.0, thus enabling 7.0 credits to be awarded under ENE02 section of the CSH report.**
4. (Residential) A separate CSH pre-assessment has been undertaken for the residential units of the development. **The CSH pre-assessment demonstrates that a “Code level 4” rating can be achieved for all dwellings.** [See the Appendix for the CSH pre-assessment report]
5. (Residential) After the application of the Energy Hierarchy, the regulated carbon dioxide emissions are presented on the table below:

	Carbon Dioxide emissions (Tonnes CO <sub>2</sub> per annum)
	<b>Regulated</b>
<b>Baseline: Building Regulations 2010 Part L Compliant Development</b>	1.249
<b>After energy demand reduction</b>	1.258
<b>After CHP/ Communal Heating</b>	1.258
<b>After renewable energy</b>	0.703

The chart below summarizes the regulated carbon dioxide savings from each stage of the Energy Hierarchy:

Regulated Carbon Dioxide savings		
	(Tonnes CO <sub>2</sub> per annum)	(%)
<b>Savings from energy demand reduction</b>	-0.009	-0.01%
<b>Savings from CHP/ Communal Heating</b>	0	0%
<b>Savings from Renewable energy</b>	0.555	44.1%
<b>Total Cumulative Savings</b>	<b>0.546</b>	<b>43.7%</b>
<b>Total Target Savings</b>	<b>0.500</b>	<b>40%</b>
<b>Annual Surplus</b>	<b>0.046</b>	

6. (Commercial) The strategy would provide a **42.7% CO<sub>2</sub> reduction saving (BER/TER) against current building regulations for the development. Therefore, the strategy meets BRUK-L2A 2013 requirements for the development.**
7. (Commercial & Residential) The strategy would provide an average of **36.8% reduction of CO<sub>2</sub> emissions the energy demand via onsite renewable technology (PV) for the whole development.**

## 10. Low & Zero Carbon Energy Systems

The following section is an overview of the LZC energy systems that are available and can be implemented to the building environment. Firstly, a brief description of the types of renewable energy (zero carbon energy) that can be harnessed with technology will be presented. In addition, the renewable energy system technologies that harness the renewable energy and convert it to electricity, heating and hot water etc, to be consumed in buildings will be presented as well.

The second part of this section will provide an indication of the available low carbon technologies that can be installed on a building to minimise carbon emissions and reduce energy costs.

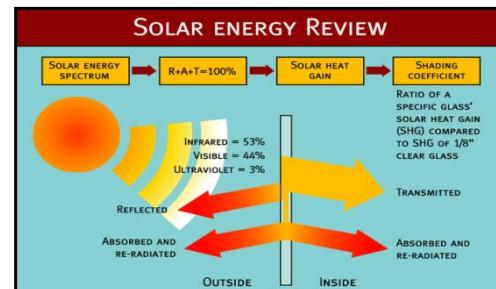

### 10.1. Zero Carbon (Renewable) Energy Overview.

Renewable energy is the energy that is grasped by the earth's abundant natural sources. Renewable energy can be harnessed with the appropriate use of technology to satisfy the human energy needs. Solar, wind, wave, tide and bio energy are termed as renewable. These renewable energy sources can be classified as 'active' or 'passive'. Active RES are the renewable sources which with the use of renewable energy systems technology (REST) can generate power and heat to satisfy the energy and heating demands of buildings. Passive RES are the renewable sources which with the use of static building elements can enhance the natural ventilation and the heating of a building.

#### Solar Energy

Solar energy is the energy of sun light. The temperature of the Sun's surface reaches to a value of approximately 5,762K. The Earth's perimeter of 40,000 km results in an intersected sun power of 174,000TW. Attenuation by the atmosphere results in peak intensity at sea level of around 1kW/m<sup>2</sup>, giving a 24 hour annual average of 0.2kW/m<sup>2</sup> and a 24 hour annual average power of 102,000 TW.

This commands the environment and maintains the life support system of Earth's ecosystem and all forms of renewable energy with the exception of geothermal energy. The solar energy reaching the earth's surface surpasses 10,000 times the current global energy demand.

To be more specific in terms of harnessing solar energy we are interested with the irradiance. Irradiance is the energy of light incident on a solar collector. Irradiance is measured in energy per area, (W/m<sup>2</sup>). The solar irradiance received on the Earth's surface consists of three components, the beam irradiance, diffuse and ground reflected irradiance. The beam component is the irradiance that reaches the solar collector directly. The diffuse irradiance is formulated due to scattering and absorption in the earth's atmosphere. Finally, the ground reflected irradiance is formed due to the sunlight reflected by the earth's ground.

#### Wind Energy

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
T: 08450091625  
Registered Company No. 06408056  
VAT Registration No. 98001604

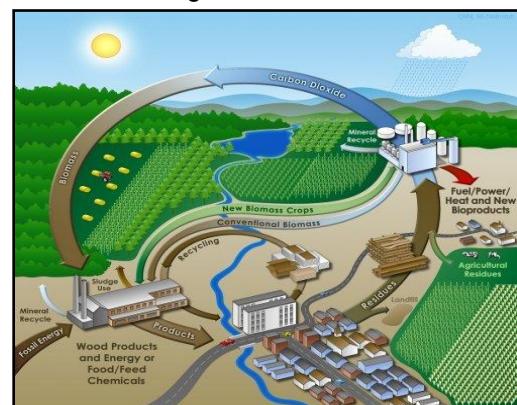

E: [mail@syntegra-epc.co.uk](mailto:mail@syntegra-epc.co.uk)

Wind energy is the energy found in the wind that is grasped by REST in order to generate power for human benefit. Wind turbines are the REST used to collect the wind resource and generate power. Today, wind turbines are used to generate electricity from the wind. There are two types of wind turbines, the horizontal axis turbine which is the most common one and the vertical axis turbine. The HAWT is the most efficient and cost effective. Most of the wind turbines used for electricity generation is of this type. Wind turbines can be found in many sizes and outputs, from small battery charging turbines (say a rotor diameter of 1 or 2 metres with an output of a few hundred Watts) to the largest machines used to supply electricity to the grid (Rotor diameters in excess of 70m and output powers of over two MW).

### Bio-energy

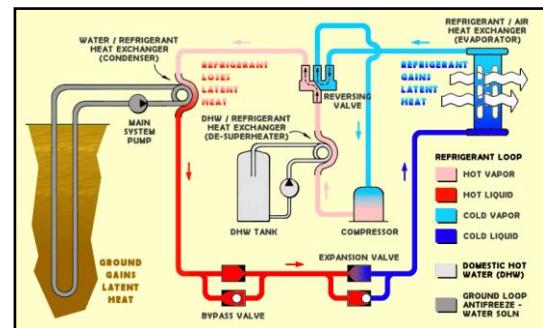

Bio-energy is the energy produced from biomass. Biomass is available from materials derived from biological sources. Biomass is any organic material which has stored sunlight in the form of chemical energy. As a fuel it may include wood, wood waste, straw, manure, sugar cane, and many other by products from a variety of agricultural processes. Energy from biomass is produced by burning organic matter.

Biomass is the solid form of 'bioenergy', but liquid fuels can also be generated from plant matter and this is referred to as 'biofuel'. Biomass is carbon-based so when used as fuel it also generates carbon emissions. However, the carbon that is released during combustion is equivalent to the amount that was absorbed during growth, and so the technology is carbon-neutral.

### Geothermal Energy

Geothermal energy is the heat from the Earth. It's clean and sustainable. Resources of geothermal energy range from the shallow ground to hot water and hot rock found a few miles beneath the Earth's surface, and down even deeper to the extremely high temperatures of molten rock called magma. Almost everywhere, the shallow ground or upper 10 feet of the Earth's surface maintains a nearly constant temperature between 10° and 16°C. Geothermal heat pumps can tap into this resource to heat and cool buildings. A geothermal heat pump system consists of a heat pump, an air delivery system (ductwork), and a heat exchanger-a system of pipes buried in the shallow ground near the building. In the winter, the heat pump removes heat from the heat exchanger and pumps it into the indoor air delivery system. In the summer, the process is reversed, and the heat pump moves heat from the

indoor air into the heat exchanger. The heat removed from the indoor air during the summer can also be used to provide a free source of hot water.

## **10.2 Zero Carbon Technologies**

In this section the zero carbon technologies also known as Renewable Energy System Technologies (REST) are described.

- Photovoltaics (PV)
- Solar Water Heating
- Wind Turbines
- Small scale Hydro Power
- Biomass Heating

### **10.2.1 Photovoltaic Systems**

#### **Description of PV Systems**

Photovoltaic systems convert energy from the sun directly into electricity. They are composed of photovoltaic cells, usually a thin wafer or strip of semiconductor material that generates a small current when sunlight strikes them. Multiple cells can be assembled into modules that can be wired in an array of any size. These flat-plate PV arrays can be mounted at a fixed angle facing south, or they can be mounted on a tracking device that follows the sun, allowing them to capture the most sunlight over the course of a day, or even in the form of a solar PV facade. Several connected PV arrays can provide enough power for a household/building.

Thin film solar cells use layers of semiconductor materials only a few micrometers thick. Thin film technology has made it possible for solar cells to now double as rooftop shingles, roof tiles, building facades, or the glazing for skylights or atria. The solar cell version of items such as shingles offer the same protection and durability as ordinary asphalt shingles.

#### **Advantages**

The PV systems are relatively simple, modular, and highly reliable due to the lack of moving parts. Moreover, PV systems do not produce any greenhouse gases, on the contrary they save approximately 325kg of CO<sub>2</sub> per year kWp they generate.

#### **Best Practice Design**

PV installations performance is proportional to the active area (area covered by PVs). The desirable location for PV panels is on a south facing roof or façade, as long as no other building or tall trees overshadows it, resulting in reduced PV efficiency. PV panels are required to be tilted at an angle to the horizontal to maximise the amount of sunlight they receive.

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
Registered Company No. 06408056

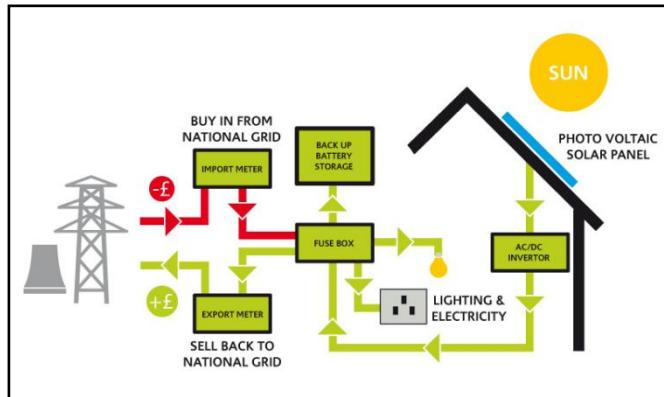

VAT Registration No. 123 456 789

strong structurally roofs due to their heavy weight, especially if the panels are placed on top of existing tiles. The area of PV panels required to generate 1 kWp varies but generally 6-8m<sup>2</sup> for mono-crystalline and 10m<sup>2</sup> for polycrystalline panels will generate 1kWp(kWp-energy generated at full sunlight) of electricity.

### **Cost & Maintenance**

Prices for PV systems vary, depending on the size of the system to be installed, type of PV cell used and the nature of the actual building on which the PV is mounted. The size of a PV system depends on the buildings electricity demand. For an average domestic system, costs of a PV system can be around £4000 - £9000 per kWp installed, with most domestic systems usually between 1.5 and 2 kWp. Solar tiles cost more than conventional panels, and panels that are integrated into a roof are more expensive than those that sit on top. Grid connected systems require very little maintenance, generally limited to ensuring that the panels are kept relatively clean and that shade from trees does not obstruct the sunlight path. However, the wiring and system components should be checked regularly by a qualified technician.

### **Available Grants**

The Feed - In - Tariffs have been introduced in order to give an incentive for PV generated electricity. The Feed-In-Tariffs scheme is based on the principle that the energy supplier pays generation tariff for every kWh the PV system generates and an export tariff for every kWh of electricity supplied back to the national grid.

**Tariff level for new Solar PV installations after 1<sup>st</sup> August 2012 (pence/kWh). For non PV technologies there will be new rates as of October 2012**

Technology	Scale	Standard generation tariff	Multi-installation tariff	Lower tariff if energy efficiency requirement not met
PV	≤4 kW (new build)	16.0	14.4	7.1
PV	≤4 kW (retrofit)	16.0	14.4	7.1
PV	>4-10 kW	14.5	13.05	7.1
PV	Stand alone system	7.1	N/A	N/A

### **10.2.2 Solar Water Heating**

#### **Description of Solar Water Heating System**

Solar water heating systems use solar energy to heat water. Depending on the type of solar collector used, the weather conditions, and the hot water demand, the temperature of the water heated can

vary from tepid to nearly boiling. Most solar systems are meant to furnish 20 to 85% of the annual demand for hot water, the remainder being met by conventional heating sources, which either raise the temperature of the water further or provide hot water when the solar water heating system cannot meet demand.

Solar systems can be used wherever moderately hot water is required. Off-the-shelf packages provide hot water to the bathroom and kitchen of a house; custom systems are designed for bigger loads, such as multi-unit apartments.

The most common collector is called a flat-plate collector. Mounted on the roof, it consists of a thin, flat, rectangular box with a transparent cover that faces the sun. Small tubes run through the box and carry the fluid – either water or other fluid, such as an antifreeze solution – to be heated. The tubes are attached to an absorber plate, which is painted black to absorb the heat. As heat builds up in the collector, it heats the fluid passing through the tubes.

### Advantages

Solar water heating can provide about a third of a typical dwellings/business hot water needs. The average domestic system reduces CO<sub>2</sub> by 325 kg per year approximately and around £50 a year of hot water bills, when installed in a gas heated home.

Fuel Displaced	£ Saving per year	CO <sub>2</sub> saving per year kg
Gas	50	325
Electricity	80	635

**Table 4**

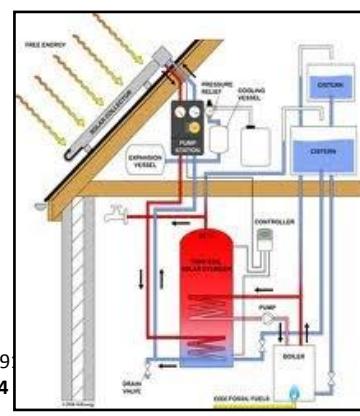

The savings presented on the previous table are approximate and are based on the hot water heating demand of a 3 bed semi detached house.

### Best Design Practice

For domestic systems a 3-4 m<sup>2</sup> of southeast to southwest facing roof receiving direct sunlight for the main part of the day is required. Also, more space will be needed if a water cylinder is required.

### Planning Issues

In England, changes to permitted development rights for micro generation technologies introduced on 6<sup>th</sup> April 2008 have lifted the requirements for planning permission for most solar water heating installations. Roof mounted and stand alone systems can now be installed in most dwellings, as long as they follow certain size criteria. Listed, English Heritage and buildings in conservation areas are exempted.

.uk

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
T: 0845009  
Registered Company No. 06408056 VAT Registration No. 98001604

### Cost & Maintenance

A typical installation cost for a domestic SHW system is £3000-£5000. Evacuated tube systems are more expensive due to their higher manufacturing cost.

SWH systems in general have a 5-10 years warranty and require little maintenance. A yearly check by the owner of the system and a more detailed maintenance check by a qualified installer every 3-5 years should be adequate.

### Available Grants

In March 2011, the UK Government announced the details of their Renewable Heat Incentive (RHI). RHI is designed to provide financial support that encourages individuals, communities and businesses to switch from using fossil fuel for heating, to renewables such as wood fuel.

There will be two phases for domestic customers:

#### **Phase 1 (available from July 2011) - “RHI Premium Payment”**

This is called the “RHI Premium Payment” and will be worth around £15m and available to 25,000 householders in Great Britain who install from July 2011.

The exact amounts available to consumers are confirmed:

- \* Solar Thermal - £300/unit

These are one off payments; so not annual. DECC plan to publish details of the “Phase 2 RHI Payment” and how this will apply next year. Recipients of this payment will need to ensure that:

- \* They have a well-insulated property based on its energy performance certificate;
- \* They agree to give feedback on how the equipment performs.

#### **Phase 2 (available from October 2012) – RHI tariffs**

People in receipt of the Renewable Heat Premium Payments will be able to receive long term RHI tariff support once these tariffs are introduced, as will anybody who has installed an eligible technology since 15th July 2009.

These tariff payments will start alongside the Green Deal from October 2012 to allow a more whole-house approach to heat production and energy saving.

### **10.2.3 Wind Turbines**

#### Description of Wind Turbine

Wind energy systems convert the kinetic energy of moving air into electricity or mechanical power. They can be used to provide power to central grids or

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
Registered Company No. 06408056

VAT Registration

isolated grids, or to serve as a remote power supply or for water pumping. Wind turbines are Commercial unitsly available in a vast range of sizes. The turbines used to charge batteries and pump water off-grid tend to be small, ranging from as small as 50 W up to 10 kW. For isolated grid applications, the turbines are typically larger, ranging from about 10 to 200 kW. Wind turbines are mounted on a tower to harness the most energy. At 30 meters or more aboveground, they can capture the faster and less turbulent wind in an urban environment. Turbines harness the wind's energy with their propeller-like blades. In most of the cases, two or three blades are mounted on a shaft to form a rotor.

There are two types of wind turbines that can be used for buildings:

- Mast mounted – which are free standing and located near the building that will be consuming the generated electricity.
- Roof Mounted – which can be installed on house roofs and other buildings.

### Planning Issues

Planning issues such as visual impact, noise and conservation issues also have to be considered. System installation normally requires permission from the local authority.

### Cost & Maintenance

- Roof mounted turbines cost from £3000. The amount of energy and carbon that roof top micro wind turbines save depends on size, location, wind speed, nearby buildings and the local landscape. At the moment there is not enough data from existing wind turbine installations to provide a figure of how much energy and CO<sub>2</sub> could typically be saved. The Energy saving trust is monitoring up to 100 installations nationwide which will give ball park figures of carbon savings.
- Mast Mounted turbines in the region of 2.5kW to 6kW would cost approximately £11000-£19000. These costs are inclusive of the turbine, mast, inverters, battery storage and installation cost. It should be noted that these costs vary depending on location, size and type of system to be installed.
- Turbines have an operational lifetime of up to 22.5 years but require service checks every few years to ensure efficient operation. For battery storage systems, typical battery life is around 6-10 years, depending on the type, so batteries may have to be replaced at some point in the system's life.

### Available Grants

The Feed - In – Tariffs have been introduced in order to give an incentive for wind generated electricity. The Feed-In-Tariffs scheme is based on the principle that the energy supplier pays generation tariff for every kWh the wind system generates and an export tariff for every kWh of electricity supplied back to the national grid.

- Generation Tariff: 28.0 – 36.20 pence/kWh depending on installed rated output (up to 15kW)

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG      T: 08450091625      E: [mail@syntegra-epc.co.uk](mailto:mail@syntegra-epc.co.uk)  
Registered Company No. 06408056      VAT Registration No. 98001604

- Export Tariff: 3.10pence/kWh
- Tariff period duration is 20 years

## **10.2.4 Small Scale Hydro**

### **Description of Small scale Hydro System**

Small hydro systems convert the potential and kinetic energy of moving water into electricity, by using a turbine that drives a generator. As water moves from a higher to lower elevation, such as in rivers and waterfalls, it carries energy with it; this energy can be harnessed by small hydro systems. Used for over one hundred years, small hydro systems are a reliable and well-understood technology that can be used to provide power to a central grid, an isolated grid or an off-grid load, and may be either run-of-river systems or include a water storage reservoir.

In a residential small scale hydro system the constant flow of water is critical to the success of the project. The energy available from a hydro turbine is proportional to the flow rate of the water and the head height. Since the majority of the cost of a small hydro project stems from up front expenses in construction and equipment purchase, a hydro project can generate large quantities of electricity with very low operating costs and modest maintenance expenditures for 50 years or longer.

### **Advantages**

For houses with no mains connection but with access to a micro hydro site, a good hydro system can generate a steady, more reliable electricity supply than other renewable technologies at lower cost. Total system costs can be high but often less than the cost of a grid connection and with no electricity bills to follow.

### **Cost & Maintenance**

Small hydro schemes are very site specific and are related to energy output. For low head systems, costs may lie in the region of £4,000 per kW installed up to about 10kW and would drop per kW for larger schemes.

For medium heads, there is a fixed cost of about £10,000 and about £2,500 per kW up to around 10kW – so a typical 5kW domestic scheme might cost £20-£25,000.

Unit costs drop for larger schemes. Maintenance costs vary but small scale hydro systems are very reliable.

### **Available Grants**

The Feed - In – Tariffs have been introduced in order to give an incentive for hydroelectric generated electricity. The Feed-In-Tariffs scheme is based on the principle that the energy supplier pays generation tariff for every kWh the hydroelectric system generates and an export tariff for every kWh of electricity supplied back to the national grid.

- Generation Tariff: 20.90 pence/kWh depending on installed rated output (up to 15kW)
- Export Tariff: 3.10pence/kWh
- Tariff period duration is 20 years

## 10.2.5 Biomass Heating

### Description of Biomass Heating System

Biomass heating systems also known as biomass boilers burn organic matter—such as wood chips, agricultural residues or municipal waste—to generate heat for buildings. They are highly efficient heating systems, achieving near complete combustion of the biomass fuel through control of the fuel and air supply, and often incorporating automatic fuel handling transport systems. Biomass boilers consist of a boiler, a heat distribution system, and a fuel transportation system. The biomass heating system typically makes use of multiple heat sources, including a waste heat recovery system, a biomass combustion system, a peak load boiler, and a back-up boiler. The heat distribution system conveys hot water or steam from the heating plant to the loads that may be located within the same building as the heating plant, as in a system for a single institutional or industrial building, or, in the case of a “district heating” system, clusters of buildings located in the vicinity of the heating plant.

Biomass heating systems have higher capital costs than conventional boilers and need diligent operators. Balancing this, they can supply large quantities of heat on demand with very low fuel costs, depending on the origin of the fuel.

### Best Design Practice

It's important to have storage space for the fuel and appropriate access to the boiler for loading the fuel. A local fuel supplier should be present in order to make the scheme viable.

The vent material must be specifically designed for wood appliances and there must be sufficient air movement for proper operation of the stove. Chimneys can be fitted with a lined flue.

A Biomass heating system installation should comply with all safety and building regulations. Wood can only be burned in exempted appliances, under the Clean Air Act.

### Advantages

Producing energy from Biomass has both environmental and economic advantages. Although Biomass produces CO<sub>2</sub> it only releases the same amount that is absorbed whilst growing, which is why it is considered to be carbon neutral. Furthermore, Biomass can contribute to waste management by harnessing energy from products that are often disposed at landfill sites.

It is most cost effective and sustainable when a local fuel source is used, which results in local investment and employment, which in addition minimizes transport emissions.

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
T: 08450091625  
Registered Company No. 06408056

E: [mail@syntegra-epc.co.uk](mailto:mail@syntegra-epc.co.uk)

VAT Registration No. 98001604

### Planning Issues

If the building is listed or is in an area of outstanding natural beauty, then it is required that the Local Authority Planning department is notified before a flue is fitted.

### Cost & Maintenance

Stand alone room heaters cost £2,000 to £4,000. Savings will depend on how much they are used and which fuel you are replacing. A Biomass stove which provides a detached home with 10% of annual space heating requirements could save around 840kg of CO<sub>2</sub> when installed in an electrically heated home. Due to the higher cost of Biomass pellets compared with other heating fuels, and the relatively low efficiency of the stove compared to a central heating system it will cost more to run.

The cost of Biomass boilers varies depending on the system choice; a typical 15kW pellet boiler would cost about £5,000-£14,000 installed, including the cost of the flue and commissioning process. A manual log feed system of the same size would be slightly cheaper. A wood pellet boiler could save around £750 a year in energy bills and around 6 tons of CO<sub>2</sub> per year when installed in an electrically heated home.

In terms of biomass fuel costs, they generally depend on the distance between the dwelling and the supplier and whether large quantities can be bought.

### Available Grants

In March 2011, the UK Government announced the details of their Renewable Heat Incentive (RHI). RHI is designed to provide financial support that encourages individuals, communities and businesses to switch from using fossil fuel for heating, to renewables such as wood fuel.

The RHI is in two phases:

#### **Phase 1 (available from July 2011) - “RHI Premium Payment”**

This is called the “RHI Premium Payment” and will be worth around £15m and available to 25,000 householders in Great Britain who install from July 2011.

The exact amounts available to consumers have yet to be confirmed. However the Department of Energy and Climate Change (DECC) have announced that the following amounts may be available:

\* Biomass boilers - £950/unit (available only to off-gas installations)

These are one off payments; so not annual. DECC plan to publish details of the “Phase 2 RHI Payment” and how this will apply next year. Recipients of this payment will need to ensure that:

- \* They have a well-insulated property based on its energy performance certificate;
- \* They agree to give feedback on how the equipment performs.

## Phase 2 (available from October 2012) – RHI tariffs

People in receipt of the Renewable Heat Premium Payments will be able to receive long term RHI tariff support once these tariffs are introduced, as will anybody who has installed an eligible technology since 15th July 2009.

These tariff payments will start alongside the Green Deal from October 2012 to allow a more whole-house approach to heat production and energy saving.

### 10.3 Low Carbon Technologies

In this section the low carbon technologies are described.

- Air Source Heat Pumps
- Ground Source Heat Pumps (GSHP)
- Combined Heat and Power (CHP)
- Micro CHP
- Fuel Cells

#### 10.3.1. Air Source Heat Pumps (ASHP)

##### Description of Air Source Heat Pumps

Air source heat pumps work in a very similar way to fridges and air conditioners and absorb heat from the air. They are ideally suited to work with under floor heating systems because of the lower design temperatures of under floor systems. The lower the water temperature, the higher the COP. Air source heat pumps use air. They are fitted outside a house; generally perform better at slightly warmer air temperatures. The seasonal efficiencies of air source heat pumps are between 200% - 400%. Heat pumps can operate at outside temperatures down to -15 degC, although there is a drop in COP.

##### Advantages

- A reduction in carbon emission.
- No boiler flues and danger of carbon monoxide leakage.
- Maintenance is carried outside the premises.
- No annual boiler servicing and safety checks.
- Heat pump life expectancy about 25 years compared to a boiler of 15 years

## Costs & Savings

Operating Cost Savings around 15% in comparison with a typical gas fired condensing boiler installation with HWS cylinder and an electrically driven Community air to water heat pump.

## Available Grants

In March 2011, the UK Government announced the details of their Renewable Heat Incentive (RHI).

RHI is designed to provide financial support that encourages individuals, communities and businesses to switch from using fossil fuel for heating, to renewables such as wood fuel.

The RHI is in two phases:

### **Phase 1 (available from July 2011) - “RHI Premium Payment”**

This is called the “RHI Premium Payment” and will be worth around £15m and available to 25,000 householders in Great Britain who install from July 2011.

The exact amounts available to consumers are confirmed:

- \* Air Source Heat Pumps - £850/unit (available only for off-gas installations)

These are one off payments; so not annual. DECC plan to publish details of the “Phase 2 RHI Payment” and how this will apply next year. Recipients of this payment will need to ensure that:

- \* They have a well-insulated property based on its energy performance certificate;
- \* They agree to give feedback on how the equipment performs.

### **Phase 2 (available from October 2012) – RHI tariffs**

People in receipt of the Renewable Heat Premium Payments will be able to receive long term RHI tariff support once these tariffs are introduced, as will anybody who has installed an eligible technology since 15th July 2009.

Whilst Air source heat pumps will be eligible for the Renewable Premium Payment, a decision on whether or not they'll be included in the tariff payments will be based upon consumer feedback on the performance of the technologies. This should be clarified towards the end of 2011.

These tariff payments will start alongside the Green Deal from October 2012 to allow a more whole-house approach to heat production and energy saving.

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
T: 08450091625  
Registered Company No. 06408056  
VAT Registration No. 98001604

E: [mail@syntegra-epc.co.uk](mailto:mail@syntegra-epc.co.uk)

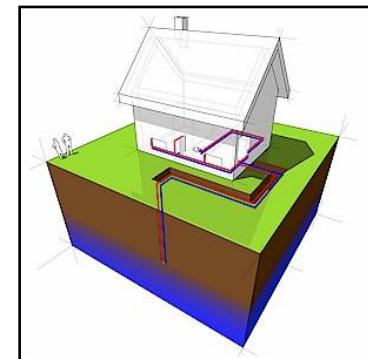

### **10.3.2 Ground Source Heat Pumps (GSHP)**

#### **Description of Ground Source Heat Pumps**

Ground-source heat pumps provide low temperature heat by extracting it from the ground or a body of water and provide cooling by reversing this process. Their principal application is space heating and cooling, though many also supply domestic hot water. They can even be used to maintain the integrity of building foundations in permafrost conditions, by keeping them frozen through the summer.

A ground-source heat pump (GSHP) system has three major components: the earth connection, a heat pump, and the heating or cooling distribution system. The earth connection is where heat transfer occurs. One common type of earth connection comprises tubing buried in horizontal trenches or vertical boreholes, or alternatively, submerged in a lake or pond. An antifreeze mixture, water or another heat-transfer fluid is circulated from the heat pump, through the tubing, and back to the heat pump in a “closed loop.” “Open loop” earth connections draw water from a well or a body of water, transfer heat to or from the water, and then return it to the ground or the body of water.

Since the energy extracted from the ground exceeds the energy used to run the heat pump, GSHP “efficiencies” can exceed 100%, and routinely average 200 to 500% over a season. Due to the stable, moderate temperature of the ground, GSHP systems are more efficient than air-source heat pumps, which exchange heat with the outside air. GSHP systems are also more efficient than conventional heating and Air-conditioning technologies, and typically have lower maintenance costs. They require less space, especially when a liquid building loop replaces voluminous air ducts, and, since the tubing is located underground, are not prone to vandalism like conventional rooftop units. Peak electricity consumption during cooling season is lower than with conventional air-conditioning, so utility demand charges may be reduced. Heat pumps typically range in cooling capacity from 3.5 to 35 kW (1 to 20 tons of Cooling). A single unit in this range is sufficient for a house or small Commercial units Building. The heat pump usually generates hot or cold air to be distributed locally by conventional ducts.

#### **Advantages**

The efficiency of GSHP system is measured by the coefficient of performance (COP). This is the ratio of units of heat output for each unit of electricity used to drive the compressor and pump for the ground loop. Average COP known as seasonal efficiency, is around 3-4 although some systems may produce a greater rate of efficiency. This means that for every unit of electricity used to pump the heat, 3-4 units of heat are produced, making it an efficient way of heating a building. If grid electricity is used for the compressor and pump, then a range of energy suppliers should be consulted in order to benefit from the lower running costs.

### Cost & Savings

A typical 8-12kW system costs £6,000-£12,000 (not including the price of distribution system). This can vary with property and location. When installed in an electrically heated home a GSHP could save as much as £900 a year on heating bills and almost 7 tonnes of CO<sub>2</sub> a year. Savings will vary depending on what fuel is being replaced.

### Available Grants

In March 2011, the UK Government announced the details of their Renewable Heat Incentive (RHI). RHI is designed to provide financial support that encourages individuals, communities and businesses to switch from using fossil fuel for heating, to renewables such as wood fuel.

There will be two phases for domestic customers:

#### **Phase 1 (available from July 2011) - “RHI Premium Payment”**

This is called the “RHI Premium Payment” and will be worth around £15m and available to 25,000 householders in Great Britain who install from July 2011.

The exact amounts available to consumers are confirmed:

\*Ground Source Heat Pumps - £1,250/unit (available for off-gas installations only)

These are one off payments; so not annual. DECC plan to publish details of the “Phase 2 RHI Payment” and how this will apply next year. Recipients of this payment will need to ensure that:

- \* They have a well-insulated property based on its energy performance certificate;
- \* They agree to give feedback on how the equipment performs.

#### **Phase 2 (available from October 2012) – RHI tariffs**

People in receipt of the Renewable Heat Premium Payments will be able to receive long term RHI tariff support once these tariffs are introduced, as will anybody who has installed an eligible technology since 15th July 2009.

These tariff payments will start alongside the Green Deal from October 2012 to allow a more whole-house approach to heat production and energy saving

### 10.3.3 Combined Heat and Power (CHP) & Micro CHP

#### Description of CHP

The principle behind combined heat and power (cogeneration) is to recover the waste heat generated by the combustion of a fuel in an electricity generation system. This

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
T: 08450  
Registered Company No. 06408056 VAT Registration No. 9800160

heat is often rejected to the environment, thereby wasting a significant portion of the energy available in the fuel that can otherwise be used for space heating and cooling, water heating, and industrial process heat and cooling loads in the vicinity of the plant. This cogeneration of electricity and heat greatly increases the overall efficiency of the system, anywhere from 25-55% to 60-90% depending on the equipment used, and the application.

A CHP installation comprises four subsystems: the power plant, the heat recovery and distribution system, an optional system for satisfying heating and/or cooling loads and a control system. A wide range of equipment can be used in the power plant, with the sole restriction being that the power equipment rejects heat at a temperature high enough to be useful for the thermal loads at hand. In a CHP system, heat may be recovered and distributed as hot water, conveyed from the plant to low temperature thermal loads in pipes for domestic hot water, or for space heating.

### Advantages

CHP can significantly reduce primary energy consumption, and can therefore have a major impact on CO<sub>2</sub> emissions associated with the combustion of fossil fuels in conventional boilers. Each 1 kW of electrical capacity provided by CHP plant using fossil fuels has the potential to reduce annual CO<sub>2</sub> emissions by around 0.6 tones compared to gas-fired boilers and fully grid-derived electricity. For plant which is fuelled by renewable energy sources the potential is much greater.

### Costs & Savings

Capital costs for CHP installations are higher than for alternative systems, but this can be recovered over a relatively short period of time (typically 5–10 years) for installations where there is a demand for heat and power for 4500 hours or more each year. The cost effectiveness is very sensitive to the relative price of electricity and fossil fuel which have been subject to frequent variations since de-regulation of the energy supply industries.

### Micro CHP

Micro CHP (Combined Heat & Power) is the simultaneous production of useful heat and power within the home. It works very much like the gas boiler in a central heating system and heats the home in just the same way. However, at the same time it generates electricity, some of which will be used in the dwelling and the remainder will be exported to the electricity grid. Effectively the micro CHP unit replaces the gas central heating boiler and provides heat and hot water as usual, but additionally provides the majority of the home's electricity needs. Although individual units produce, by definition, relatively small amounts of electricity, the significance of micro CHP lies in the potentially huge numbers of systems which may ultimately be installed in the millions of homes in the UK where natural gas is currently the dominant heating fuel.

### Available grants

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG  
T: 08450091625  
Registered Company No. 06408056  
VAT Registration No. 98001604

E: [mail@syntegra-epc.co.uk](mailto:mail@syntegra-epc.co.uk)

The Feed - In – Tariffs have been introduced in order to give an incentive for micro CHP generated electricity. The Feed-In-Tariffs scheme is based on the principle that the energy supplier pays generation tariff for every kWh the micro CHP system generates and an export tariff for every kWh of electricity supplied back to the national grid.

- Generation Tariff: 10.50 pence/kWh depending on installed rated output (up to 2KW)
- Export Tariff: 3.10pence/kWh
- Tariff period duration is 10 years

### 10.3.4 Fuel Cells

#### Description of Fuel Cells

A fuel cell is a device that generates more electricity by a chemical reaction. Every fuel cell has two electrodes, one positive and one negative, called, respectively, the anode and cathode. The reactions that produce electricity take place at the electrodes.

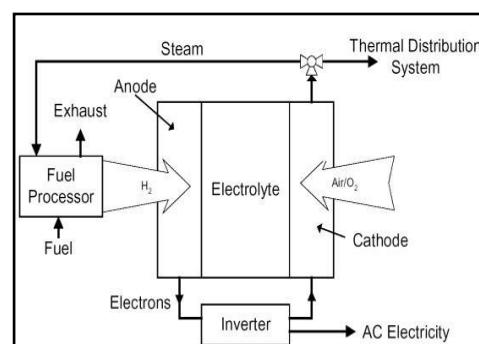

Every fuel cell also has an electrolyte, which carries electrically charged particles from one electrode to the other, and a catalyst, which speeds the reactions at the electrodes. Hydrogen is the basic fuel, but fuel cells also require oxygen.

One great appeal of fuel cells is that they generate electricity with very little pollution—much of the hydrogen and oxygen used in generating electricity ultimately combine to form a harmless by product, namely water.

#### Fuel Cell Operation

The purpose of a fuel cell is to produce an electrical current that can be directed outside the cell to do work, such as powering an electric motor or illuminating a light bulb or a city. Because of the way electricity behaves, this current returns to the fuel cell, completing an electrical circuit. The chemical reactions that produce this current are the key to how a fuel cell works.

There are several kinds of fuel cells, and each operates a bit differently. But in general terms, hydrogen atoms enter a fuel cell at the anode where a chemical reaction strips them of their electrons. The hydrogen atoms are now “ionized,” and carry a positive electrical charge. The negatively charged electrons provide the current through wires to do work. If alternating current (AC) is needed, the DC output of the fuel cell must be routed through a conversion device called an inverter.

#### Advantages

Even better, since fuel cells create electricity chemically, rather than by combustion, they are not subject to the thermodynamic laws that limit a conventional power plant. Therefore, fuel cells are

more efficient in extracting energy from a fuel. Waste heat from some cells can also be harnessed, boosting system efficiency still further.

### Fuel Cells with Hydrogen from Renewable Sources

Fuel cells can be used as CHP systems in buildings. There are currently several different systems under development using different chemical processes, which operate at different temperatures. They currently use natural gas as the fuel, which is reformed to produce hydrogen, the required fuel for the fuel cell. When and if hydrogen becomes available from renewable energy, fuel cell CHP from renewable sources may be possible in buildings.

## 11. BE GREEN – RENEWABLE ENERGY

In this section the viable renewable energy technologies that will reduce the development's CO<sub>2</sub> emissions further by 20% are examined. Incorporating green design measures will significantly reduce the onsite energy consumption and the CO<sub>2</sub> emissions of the building. The 'London Plan' states that a further CO<sub>2</sub> reduction of 20% must be achieved by the installation of renewable technologies. Below is a review of possible renewable technologies for incorporation in the proposed development.

All of the LZC technologies are assessed against a number of criteria. Hence, LZC technology feasibility will be assessed according to the following criteria:

- VI. Renewable energy resource or fuel availability of the LZC technology on the site.
- VII. Space limitations due to building design and urban location of the site.
- VIII. Capital, operating and maintenance cost.
- IX. Planning Permission
- X. Implementation with regards the overall M&E design strategy for building type

The **ADDITIONAL** renewable/LZC technologies which were found non feasible based on the above criteria are the following:

- Wind Turbines
- Biomass Boilers
- Micro CHP
- Hydrogen Fuel Cells
- Small scale hydro power
- Grd. Source Heat Pump (GSHP)

### 11.1 Wind Turbines

Wind turbines are not feasible for the development since it does not meet the criteria mentioned above. Since the development is located in a dense residential and Commercial units area; the wind resource may be restricted due to the adjacent large trees and air turbulence generated between them. The yearly average wind speed is quite low at 10 meters above ground.

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG      T: 08450091625  
Registered Company No. 06408056      VAT Registration No. 98001604

E: [mail@syntegra-epc.co.uk](mailto:mail@syntegra-epc.co.uk)

Wind speed at 10m above ground level (m/s)

4.9	5.3	5.6
4.8	4.8	5
4.9	4.8	4.9

Wind speed at 25m above ground level (m/s)

5.7	6	6.3
5.6	5.6	5.8
5.7	5.6	5.7

Wind speed at 45m above ground level (m/s)

6.2	6.5	6.7
6.1	6.2	6.3
6.1	6.1	6.2

Squares surrounding the central square correspond to wind speeds for surrounding grid squares.

What does this mean?

Power generated is related to wind-speed by a cubic ratio. That means if you halve the wind-speed, the power goes down by a factor of 8 (which is  $2 \times 2 \times 2$ ). A quarter of the wind-speed gives you a 64<sup>th</sup> of the power ( $4 \times 4 \times 4$ ).

As a rough guide, if your turbine is rated at producing 1KW at 12m/s then it will produce 125W at 6m/s and 15W at 3m/s.

**Please Note!**

Bear in mind that the NOABL wind-speed dataset used here is a model of wind-speeds across the country, assuming **completely flat terrain**. It isn't a database of measured wind-speeds. Other

factors such as hills, houses, trees and other obstructions in your vicinity need to be considered as well as they can have a significant effect.

An actual wind-speed measurement using an anemometer has not been used for the purpose of this energy strategy report.

The central square highlighted in yellow demonstrates the average wind speed in m/s for the site. Squares surrounding the central square correspond to wind speeds for surrounding grid squares. From the above table it is shown that the average wind speed on the development according to **NOABL database was estimated at 4.8m/s at 10m high above ground and 5.6m/s at 25m above ground.**

Wind turbine(s) have been discounted for this development scheme for the following reasons:

- A large mast horizontal axis wind turbine will not be able to generate electricity at optimal operating range since it requires higher average wind speeds. Furthermore, the installation of small scale wind turbines won't be feasible due to low average wind speed at 10 meters height, 25m & 45metre heights.
- Due to the close proximity of neighboring Commercial units & residential properties and trees.
- In addition, the low frequency noise generated by wind turbines might cause inconvenience to the neighboring residents. However, the level a person can be affected by low frequency noise varies from individual to individual.
- Due to the size and the required height of a potential wind turbine scheme there is also an issue with the propellers' impacting bird traffic, obtrusiveness, shadow flicker which means that generally large wind turbines need to be located at least 300m from any residential properties, which would not be possible on this site.
- Roof mounted units are limited in size due to wind induced stresses which are transmitted to the building structure. Most roof mounted turbines currently on the market are approximately 2m diameter and capable of producing 1-1.5kW each. However, the output is dependent on the surrounding obstructions and local wind speed. Thus small scale wind turbines would not make any meaningful impact on a site such as this.
- There are likely to be planning issues associated with wind turbines of a size necessary to affect any significant CO2 savings or energy savings.
- Because of the above the investment case with regards this technology solution is not viable compared to other solutions with a more attractive ROI.
- Finally, the installation of wind turbines on the development requires planning permission (and is likely to instigate neighborhood committee interest regarding its aesthetics and acoustic issues).

## 11.2 Biomass Boilers

Biomass boilers should not be considered for this project due to the following reasons:

- Furthermore, in common with other types of combustion appliances, biomass boilers are potentially a source of air pollution. Pollutants associated with biomass combustion include

particulate matter (PM<sub>10</sub>/ PM<sub>2.5</sub>) and nitrogen oxides (NO<sub>x</sub>) EMISSIONS. These pollution emissions can have an impact on local air quality and affect human health. Biomass has recently been rejected by many London Boroughs as means of obtaining the on-site renewable contribution (and this will soon send ripples out to other regions). This is because of their associated flue emissions (which can be significantly higher than gas fired boilers) and the difficulty of ensuring the boiler will operate at its optimum efficiency, which is often quoted by designers at the initial design stages. Biomass flue emissions are often difficult to control because the quality of fuel can vary significantly between suppliers. Given this a bio fuel system may not be acceptable to the Council on planning grounds (e.g. concerns about associated flue emissions/impact on local 'Air Quality', increase in road traffic from pellet delivery lorries).

- Biomass fuel requires more onerous and frequent wood fuel silo (site storage issues) replenishing by delivery trucks- which in turn can cause site transportation issues that will need to be considered and addressed along with the impact on the other residents and neighborhood infrastructure.
- Restrictions on the type of fuel and appliance may apply to the development and according to studies commissioned by DEFRA the levels of particles emitted by the burning of wood chip or waste would be considered to outweigh the benefits of carbon reduction especially in an urban environment such as the proposed development site.
- Dependant on a fuel supply chain contract being confirmed.
- There is no suitable location for the plant and storage of the pellets on site at present.
- The whole of London Borough of Hillington is in a smoke control zone.

### **11.3 Hydrogen Fuel Cells**

Not Commercial unitsly viable yet - As a result this solution will not be assessed any further.

The BlueGen product is a ceramic fuel cell and has recently entered the UK market this year.

Using ceramic fuel cells, BlueGen® electrochemically converts natural gas into electricity at up to 60 per cent electrical efficiency. Electricity is consumed locally, with unused power being exported to the grid. When the integrated heat recovery system is connected, the waste heat from BlueGen can be used to produce hot water - which improves the total efficiency to approximately 85 per cent.

### **11.4 Small scale Hydro**

Small scale hydro-electric will not be studied any further because of the location and the spatial limitations of the development. There is no river or lake within the development site boundaries. As a result this solution will not be assessed any further.

### **11.5 Ground Source Heat pump (GSHP)**

GSHP will not be studied any further for the following reasons:

Syntegra Consulting Ltd, Syntegra House, 63 Milford Road, Reading, RG1 8LG      T: 08450091625  
Registered Company No. 06408056      VAT Registration No. 98001604

E: [mail@syntegra-epc.co.uk](mailto:mail@syntegra-epc.co.uk)

- If an open loop configuration was to be adopted, a test borehole would be needed to assess the available resource. The test resource process is expensive and of course does not guarantee an acceptable resource in the ground. Additionally, a closed loop borehole configuration could not be used due to spatial limitations of the site.
- There are likely to be planning issues associated with borehole excavation and drilling.
- Running costs and maintenance may be minimal. However, installation is a costly affair. A GSHP solution would represent a relatively expensive option in comparison to other renewable technologies available.
- Additional electric immersion and pumps would be required to heat the GSHP water up to suitable temperature to be used around the building and it's likely a centralised plant area will also be required to house the circulation pumps.
- This technology is not recommended due to the increased plant energy consumption requirements in turn impacting the DER/TER score for the required energy strategy objectives.
- Furthermore, boreholes also destabilize the ground surface and may be considered a minus for environmentally friendly endeavours.

## 11.6 CHP & Micro CHP

CHP has not been considered further for this project for the following reasons:

- The average maximum heating load of a new apartment (built to 2010 building regs) is approximately 3kW and therefore most individual heating systems with independent condensing gas boilers would be incapable of working at optimal efficiencies or achieving their stated SEDBUK rating due to boiler cycling.
- Traditional CHP should not be considered for this project due to the spatial constraints of the development plot and dwelling layouts. There is not suitable space in the development for CHP plant.
- Heat from the CHP plant could be utilized to drive an absorption chiller during the summer months (tri-generation), but due to the sustainable design of the building fabric, and the use of natural ventilation wherever possible, we anticipate that the cooling load will be minimal, making this a non-viable proposition.
- Micro-CHP is a relatively new concept (Baxi Ecogen was made available in 2009) and issues are raised in relation to unproven technology, inefficiency for shorter run cycles and lack of technical knowledge that can limit the practical application of micro CHP at present. In addition other issues surrounding the fact that around 50% of electricity generated in domestic properties is surplus, high installation costs and estimated low life expectancy has also been taken into consideration as to its Commercial units un-viability for this development scheme. Micro-CHP also has a lower FIT tariff rate and period duration and is only applicable for systems under 2kW

# Regulations Compliance Report

Approved Document L1A, 2013 Edition, England assessed by Stroma FSAP 2012 program, Version: 1.0.0.6  
Printed on 12 May 2014 at 12:26:44

## Project Information:

Assessed By: ( )

Building Type: Semi-detached Flat

## Dwelling Details:

### NEW DWELLING DESIGN STAGE

Total Floor Area: 47.6m<sup>2</sup>

Site Reference : 2 Midcroft

Plot Reference: Flat 2

Address : 2 Midcroft , Ruislip, HA4 8ES

## Client Details:

Name:

Address :

This report covers items included within the SAP calculations.

It is not a complete report of regulations compliance.

## 1a TER and DER

Fuel for main heating system: Mains gas

Fuel factor: 1.00 (mains gas)

Target Carbon Dioxide Emission Rate (TER)

18.37 kg/m<sup>2</sup>

Dwelling Carbon Dioxide Emission Rate (DER)

9.31 kg/m<sup>2</sup>

OK

## 1b TFEE and DFEE

Target Fabric Energy Efficiency (TFEE)

39.20 kWh/m<sup>2</sup>

Dwelling Fabric Energy Efficiency (DFEE)

34.20 kWh/m<sup>2</sup>

OK

## 2 Fabric U-values

### Element

External wall

Average

0.18 (max. 0.30)

Floor

(no floor)

Roof

(no roof)

Openings

1.40 (max. 2.00)

Highest

0.18 (max. 0.70)

## 2a Thermal bridging

Thermal bridging calculated from linear thermal transmittances for each junction

## 3 Air permeability

Air permeability at 50 pascals

4.00 (designn value)

Maximum

10.0

OK

## 4 Heating efficiency

Main Heating system:

Database: (rev 355, product index 015701):

Boiler systems with radiators or underfloor heating - mains gas

Brand name: Main

Model: Combi

Model qualifier: 25 Eco  
(Combi)

Efficiency 89.0 % SEDBUK2009

Minimum 88.0 %

OK

Secondary heating system: None

# Regulations Compliance Report

## 5 Cylinder insulation

Hot water Storage: No cylinder

## 6 Controls

Space heating controls TTZC by plumbing and electrical services **OK**  
Hot water controls: No cylinder  
Boiler interlock: Yes **OK**

## 7 Low energy lights

Percentage of fixed lights with low-energy fittings 100.0%  
Minimum 75.0% **OK**

## 8 Mechanical ventilation

Not applicable

## 9 Summertime temperature

Overheating risk (Thames valley): **OK**

Based on:

Overshading: Average or unknown

Windows facing: South East 9.1m<sup>2</sup>,

Windows facing: South West 0.9m<sup>2</sup>,

Ventilation rate: 6.00

Blinds/curtains: Closed 30% of daylight hours

## Evidence for ENE 1 (Dwelling Emission Rate)

Improvement above Part L Building Regulations 2010. 4.7 credits allocated

Evidence : Energy strategy report

As per energy strategy report, based on a combi boiler + PV strategy Part L1 regs can achieve an average of 43.7% improvement. - Code level 4 for ENE1

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 1

## Evidence for ENE 2 (Fabric Energy Efficiency)

Apartment

7 credits allocated

As per energy strategy report, assumed average Fabric Energy Efficiency of 39.0

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 2

## Evidence for ENE 3 (Energy Display Device)

Correctly specified display device showing current consumption data.

Assumed a code compliant energy display device will be installed showing the electricity consumption data.

## Assumptions for ENE 3

## Evidence for ENE 4 (Drying Space)

Compliant internal drying space

It has been assumed that code compliant internal drying line of 4m+ will be provided in the bathrooms (over tub area with permanent fixtures).

Evidence : Architectural drawings

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Compliant space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoages are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of at least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Evidence :Statement of fitting specification(flow rates/capacity), WHB, WC's, Baths, Showers

Code assessors WAT 1 calculation output tool

## Assumptions for WAT 1

## Evidence for WAT 2 (External Water Use)

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

## Evidence for ENE 1 (Dwelling Emission Rate)

Improvement above Part L Building Regulations 2010. 4.7 credits allocated

Evidence : Energy strategy report

As per energy strategy report, based on a combi boiler + PV strategy Part L1 regs can achieve an average of 43.7% improvement. - Code level 4 for ENE1

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 1

## Evidence for ENE 2 (Fabric Energy Efficiency)

Apartment

7 credits allocated

As per energy strategy report, assumed average Fabric Energy Efficiency of 39.0

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 2

## Evidence for ENE 3 (Energy Display Device)

Correctly specified display device showing current consumption data.

Assumed a code compliant energy display device will be installed showing the electricity consumption data.

## Assumptions for ENE 3

## Evidence for ENE 4 (Drying Space)

Compliant internal drying space

It has been assumed that code compliant internal drying line of 4m+ will be provided in the bathrooms (over tub area with permanent fixtures).

Evidence : Architectural drawings

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Compliant space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoages are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of at least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Evidence : Statement of fitting specification(flow rates/capacity), WHB, WC's, Baths, Showers

Code assessors WAT 1 calculation output tool

## Assumptions for WAT 1

## Evidence for WAT 2 (External Water Use)

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

## Evidence for ENE 1 (Dwelling Emission Rate)

Improvement above Part L Building Regulations 2010. 4.7 credits allocated

Evidence : Energy strategy report

As per energy strategy report, based on a combi boiler + PV strategy Part L1 regs can achieve an average of 43.7% improvement. - Code level 4 for ENE1

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 1

## Evidence for ENE 2 (Fabric Energy Efficiency)

Apartment

7 credits allocated

As per energy strategy report, assumed average Fabric Energy Efficiency of 39.0

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 2

## Evidence for ENE 3 (Energy Display Device)

Correctly specified display device showing current consumption data.

Assumed a code compliant energy display device will be installed showing the electricity consumption data.

## Assumptions for ENE 3

## Evidence for ENE 4 (Drying Space)

Compliant internal drying space

It has been assumed that code compliant internal drying line of 4m+ will be provided in the bathrooms (over tub area with permanent fixtures).

Evidence : Architectural drawings

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Complaint space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoagres are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of a t least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Evidence :Statement of fitting specification(flow rates/capacity), WHB, WC's, Baths, Showers

Code assessors WAT 1 calculation output tool

## Assumptions for WAT 1

## Evidence for WAT 2 (External Water Use)

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

## Summary Score Sheet

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Compliant space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoages are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of at least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Evidence :Statement of fitting specification(flow rates/capacity), WHB, WC's, Baths, Showers

Code assessors WAT 1 calculation output tool

## Assumptions for WAT 1

## Evidence for WAT 2 (External Water Use)

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

## Evidence for ENE 1 (Dwelling Emission Rate)

Improvement above Part L Building Regulations 2010. 4.7 credits allocated

Evidence : Energy strategy report

As per energy strategy report, based on a combi boiler + PV strategy Part L1 regs can achieve an average of 43.7% improvement. - Code level 4 for ENE1

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 1

## Evidence for ENE 2 (Fabric Energy Efficiency)

Apartment

7 credits allocated

As per energy strategy report, assumed average Fabric Energy Efficiency of 39.0

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 2

## Evidence for ENE 3 (Energy Display Device)

Correctly specified display device showing current consumption data.

Assumed a code compliant energy display device will be installed showing the electricity consumption data.

## Assumptions for ENE 3

## Evidence for ENE 4 (Drying Space)

Compliant internal drying space

It has been assumed that code compliant internal drying line of 4m+ will be provided in the bathrooms (over tub area with permanent fixtures).

Evidence : Architectural drawings

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Compliant space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoages are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of at least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Assumptions for ENE 2

## Evidence for ENE 3 (Energy Display Device)

Correctly specified display device showing current consumption data.

Assumed a code compliant energy display device will be installed showing the electricity consumption data.

## Assumptions for ENE 3

## Evidence for ENE 4 (Drying Space)

Compliant internal drying space

It has been assumed that code compliant internal drying line of 4m+ will be provided in the bathrooms (over tub area with permanent fixtures).

Evidence : Architectural drawings

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Compliant space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoagres are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of a t least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Evidence :Statement of fitting specification(flow rates/capacity), WHB, WC's, Baths, Showers

Code assessors WAT 1 calculation output tool

## Assumptions for WAT 1

## Evidence for WAT 2 (External Water Use)

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

## Evidence for ENE 1 (Dwelling Emission Rate)

Improvement above Part L Building Regulations 2010. 4.7 credits allocated

Evidence : Energy strategy report

As per energy strategy report, based on a combi boiler + PV strategy Part L1 regs can achieve an average of 43.7% improvement. - Code level 4 for ENE1

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 1

## Evidence for ENE 2 (Fabric Energy Efficiency)

Apartment

7 credits allocated

As per energy strategy report, assumed average Fabric Energy Efficiency of 39.0

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 2

## Evidence for ENE 3 (Energy Display Device)

Correctly specified display device showing current consumption data.

Assumed a code compliant energy display device will be installed showing the electricity consumption data.

## Assumptions for ENE 3

## Evidence for ENE 4 (Drying Space)

Compliant internal drying space

It has been assumed that code compliant internal drying line of 4m+ will be provided in the bathrooms (over tub area with permanent fixtures).

Evidence : Architectural drawings

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Complaint space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoagres are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of a t least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Evidence :Statement of fitting specification(flow rates/capacity), WHB, WC's, Baths, Showers

Code assessors WAT 1 calculation output tool

## Assumptions for WAT 1

## Evidence for WAT 2 (External Water Use)

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

## Summary Score Sheet

Dwelling Type: Flat 11 2 Midcroft

Dwelling ID: 11

## Evidence for ENE 1 (Dwelling Emission Rate)

Improvement above Part L Building Regulations 2010. 4.7 credits allocated

Evidence : Energy strategy report

As per energy strategy report, based on a combi boiler + PV strategy Part L1 regs can achieve an average of 43.7% improvement. - Code level 4 for ENE1

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 1

## Evidence for ENE 2 (Fabric Energy Efficiency)

Apartment

7 credits allocated

As per energy strategy report, assumed average Fabric Energy Efficiency of 39.0

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 2

## Evidence for ENE 3 (Energy Display Device)

Correctly specified display device showing current consumption data.

Assumed a code compliant energy display device will be installed showing the electricity consumption data.

## Assumptions for ENE 3

## Evidence for ENE 4 (Drying Space)

Compliant internal drying space

It has been assumed that code compliant internal drying line of 4m+ will be provided in the bathrooms (over tub area with permanent fixtures).

Evidence : Architectural drawings

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Compliant space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoagres are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of a t least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Evidence :Statement of fitting specification(flow rates/capacity), WHB, WC's, Baths, Showers

Code assessors WAT 1 calculation output tool

## Assumptions for WAT 1

## Evidence for WAT 2 (External Water Use)

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

## Summary Score Sheet

Dwelling Type: Flat 13 2 Midcroft

## Evidence for ENE 1 (Dwelling Emission Rate)

Improvement above Part L Building Regulations 2010. 4.7 credits allocated

Evidence : Energy strategy report

As per energy strategy report, based on a combi boiler + PV strategy Part L1 regs can achieve an average of 43.7% improvement. - Code level 4 for ENE1

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 1

## Evidence for ENE 2 (Fabric Energy Efficiency)

Apartment

7 credits allocated

As per energy strategy report, assumed average Fabric Energy Efficiency of 39.0

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 2

## Evidence for ENE 3 (Energy Display Device)

Correctly specified display device showing current consumption data.

Assumed a code compliant energy display device will be installed showing the electricity consumption data.

## Assumptions for ENE 3

## Evidence for ENE 4 (Drying Space)

Compliant internal drying space

It has been assumed that code compliant internal drying line of 4m+ will be provided in the bathrooms (over tub area with permanent fixtures).

Evidence : Architectural drawings

## Assumptions for ENE 4

## Evidence for ENE 5 (Energy Labelled White Goods)

A+ rated fridge &amp; freezers or fridge/freezer

A rated washing machine and dishwasher, AND EITHER a tumble dryer (a washer-dryer would be an acceptable alternative to a standalone tumble dryer) with a B rating or where a tumble dryer is not provided, the EU Energy Efficiency Labelling Scheme Information will be provided.

It has been assumed that the fridges& freezers will be A+ Rated, A rated washing machines and dishwashers and either Brated washer-dryers and tumble dryers, or EU Energy Efficiency Labelling Scheme Leaflet will be provided where washer dryer and/or dishwasher not provided.

## Assumptions for ENE 5

## Evidence for ENE 6 (External Lighting)

Compliant space lighting, no security lighting installed

It is anticipated that all communal &amp; external space lighting is provided by dedicated energy efficient fittings with appropriate control systems.

An LED lighting and control strategy would assist toward compliance to this credit(s). 100% Low Energy lighting assumed to achieve 45+lumens per circuit watt

## Assumptions for ENE 6

## Evidence for ENE 7 (Low or Zero Carbon Energy Technologies)

Contribution of low or zero carbon technologies greater than or equal to 10%

As per energy strategy report, based on the combi boiler + PV strategy a CO2 emissions reduction improvement of more than 10% can be attained against the standard case for ENE7.

Evidence : Energy strategy report

Evidence : SAP assessments and BRUKL compliance reports

Evidence : Architectural drawings

## Assumptions for ENE 7

## Evidence for ENE 8 (Cycle Storage)

Studio or 1 bedroom dwelling - Storage for 1 cycle per two dwellings

2 or 3 bedroom dwelling - Storage for 1 cycle per dwelling

It has been assumed that the 2 bedroom dwellings will be provided with 1 cycle storage per dwelling. Also the studios will be provided with 2 cycles. Hence, in total 13 cycle stoages are required. 1 credit has been assumed

## Assumptions for ENE 8

## Evidence for ENE 9 (Home Office)

Compliant home office

It has been assumed that a code compliant home office location is present. Including a daylight factor of 1.5% (daylight calculation report required for justification). The room requires adequate ventilation (either ventilation system or opening window of at least 0.5m<sup>2</sup>), 2No. double power sockets, one telephone point and broadband provision.

It is assumed that the home office location will be located in the combined kitchen/living area.

Evidence : Floorplans and elevations &amp; specification

## Assumptions for ENE 9

## Evidence for WAT 1 (Internal Water Use)

Internal water use less than or equal to 105 litres per person per day

It is assumed the minimum code 4 requirement of 105litres/day will be achieved via a correct specification of low flow/flush fittings. Also that the design will be undertaken under risk assessment to avoid microbial contamination for the HWS &amp; CWS systems as per CIBSE guidance

Evidence :Statement of fitting specification(flow rates/capacity), WHB, WC's, Baths, Showers

Code assessors WAT 1 calculation output tool

## Assumptions for WAT 1

## Evidence for WAT 2 (External Water Use)

Balconies provided

Since balconies are provided, 1 credit can be awarded by default.

## Assumptions for WAT 2

## Evidence for MAT 1 (Environmental Impact of Materials)

Mandatory requirements met: At least 3 elements rated A+ to D, 10 credits scored

It is assumed that the mandatory requirement will be met in achieving a rating of A+ to D in the 2008 version of the Green Guide for the following elements: Roof, external walls, internal walls (including separating walls), upper and ground floors (including separating floors), windows.

In addition we assume a target of 10 credits will be achieved through correct materials specification accordingly for this category.

## Assumptions for MAT 1

## Evidence for MAT 2 (Responsible Sourcing (Basic Building Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 2

## Evidence for MAT 3 (Responsible Sourcing (Finishing Elements))

Zero credits or credits not sought

This credit is not sought

## Assumptions for MAT 3

## Evidence for SUR 1 (Management of Surface Water Run-Off from Site)

Mandatory Met: Peak rate of run-off and annual volume of run-off is no greater for the developed than for the pre-development. The system has also been designed for local drainage system failure.

It has been assumed the mandatory requirements for the code are met and that there is no change/decrease in impermeable area.

Evidence : Floorplans and elevations

## Assumptions for SUR 1

## Evidence for SUR 2 (Flood Risk)

Low flood risk - zone 1

It is assumed the development is in a flood risk 1 zone and the appropriate measures will be incorporated.

## Assumptions for SUR 2

## Evidence for WAS 1 (Household Waste Storage and Recycling Facilities)

Mandatory requirements met: Adequate storage of household waste with accessibility in line with checklist WAS 1. Local authority collection: After collection sorting with appropriate internal storage of recyclable materials

It has been assumed that the mandatory household waste storage requirement will be met and that there is a local authority recycling collection scheme (at least fortnightly) where materials are sorted after collection in at least 3 No. dedicated internal storage recycling bin at least 30 litres for each property (min 7 litres per bin).

## Assumptions for WAS 1

## Evidence for WAS 2 (Construction Site Waste Management)

Compliant site waste management plan containing benchmarks, procedures and commitments for the minimizing and diverting 50% waste from landfill in line with the criteria and with Checklist WAS 2a, 2b & 2c

It has been assumed that a compliant SWMP will be in place and more than 50% of waste will be diverted from landfill.

## Assumptions for WAS 2

## Evidence for WAS 3 (Composting)

Local authority green waste collection scheme

Local authority kitchen waste collection scheme - No Garden

It has been assumed that local council green waste and kitchen waste collection scheme will be in place. Hence 1 credit can be awarded

## Assumptions for WAS 3

## Evidence for POL 1 (Global Warming Potential of Insulants)

All insulants have a GWP of less than 5

It has been assumed that all insulants have GWP of less than 5.

## Assumptions for POL 1

## Evidence for POL 2 (NOx Emissions)

NOx emissions less than or equal to 40mg/kWh

Assumed NOx emissions are less than or equal to 40mg/kWh per dwelling.

## Assumptions for POL 2

## Evidence for HEA 1 (Daylighting)

Kitchen: Average daylight factor of at least 2%

Living room: Average daylight factor of at least 1.5%

Dining room: Average daylight factor of at least 1.5%

Home office: Average daylight factor of at least 1.5%

All rooms (kitchen, living, dining and where applicable the home office) have 80% of the working plane with direct light from the sky

It is assumed that all kitchens, living/dining rooms, home office areas achieve a daylight factor of 1.5% and that all rooms (kitchen, living room, and home office) have 80% of the working plane in direct light from the sky.

## Assumptions for HEA 1

## Evidence for HEA 2 (Sound Insulation)

Accredited Part E sound testing has been undertaken

Airborne 5dB higher, impact 5dB lower

It has been assumed that Sound testing will be carried out and better results by 5dB will be achieved

## Assumptions for HEA 2

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

## Evidence for HEA 3 (Private Space)

Individual private space provided.

Balconies and private space have been provided to all of the dwellings.

Evidence: Architectural Plans

## Assumptions for HEA 3

## Evidence for HEA 4 (Lifetime Homes)

All criteria of Lifetime Homes in line with all 16 principals of Lifetime Homes

Assumed lifetime homes criteria will be met.

## Assumptions for HEA 4

## Evidence for MAN 1 (Home User Guide)

All criteria inline with checklist MAN 1 Part 1 - Operational Issues will be met

All criteria inline with checklist MAN 1 Part 2 - Site and Surroundings will be met

It is assumed a code compliant Home User Guide will be produced and made available in the appropriate formats to residents. It is assumed that the Home User Guide meets the criteria for operational issues and site & surrounds.

## Assumptions for MAN 1

## Evidence for MAN 2 (Considerate Constructors Scheme)

Considerate constructors scheme: Best practise only, a score of between 25 - 34, and at least a score of 5 in each section\*

Assumed the contractor will be onboard the considerate constructors scheme and score between 25-34 credits and at least a score of 5 in each section.

## Assumptions for MAN 2

## Evidence for MAN 3 (Construction Site Impacts)

Monitor, report and set targets for CO2 production or energy use from site activities

Monitor, report and set targets for water consumption from site activities

Adopt best practise policies in respects to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

It is assumed that during site works the contractor will, as part of the live SWMP document, monitor/report/set targets for the following:

Adopt best practise policies in respect to air (dust) pollution from site activities

80% of timber reclaimed, re-used or responsibly sourced

energy and water consumption targeted and monitored from site activities.

## Assumptions for MAN 3

## Evidence for MAN 4 (Security)

Secured by design section 2 compliant

It has been assumed that an ALO/CPDA from the local police force is consulted at the design stage and their recommendations will be incorporated into the design of the development. Also that Section 2 of the Physical security from secured by design -new homes is complied with.

## Assumptions for MAN 4

## Evidence for ECO 1 (Ecological Value of Site)

Land of low ecological value, achieved through checklist ECO 1. Development site has been identified as low ecological value by a suitably qualified ecologist

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value.

## Assumptions for ECO 1

## Evidence for ECO 2 (Ecological Enhancement)

Key recommendations and 30% additional recommendations by a suitably qualified ecologist

It is assumed that the client will undertake key recommendations outlined by the ecologist along with 30% of additional recommendations.

## Assumptions for ECO 2

## Evidence for ECO 3 (Protection of Ecological Features)

Land of low ecological value as identified under ECO 1

It is assumed that an ecologist will be appointed and confirm that the land is of low ecological value/any ecological features will be protected and maintained during construction.

## Assumptions for ECO 3

## Evidence for ECO 4 (Change of Ecological Value of Site)

Neutral: Greater than -3 and less than or equal to +3

It is assumed that an ecologist will be appointed and neutral enhancements will be made.

## Assumptions for ECO 4

## Evidence for ECO 5 (Building Footprint)

Flats ratio of 4:1

Ground floor NIA = 201.5m<sup>2</sup>1st floor NIA = 419m<sup>2</sup>2nd floor NIA = 419m<sup>2</sup>3rd floor NIA = 339m<sup>2</sup>Total = 1378.5 m<sup>2</sup>

Ratio = 6.84:1

Therefore 2 credits can be achieved.

## Assumptions for ECO 5

**Assessor Declaration**

I Alan King, can confirm that I have compiled this report to the best of my ability, I have based all findings on the information that is referenced within this report, and that this report is appropriate for the registered site.

To the best of my knowledge all the information contained within this report is correct and accurate. I have within my possession all the reference material that relates to this report, which is available for inspection by the client, the clients representative or Stroma Certification for Quality Assurance monitoring.

Signed:

Alan King

## Information about Code for Sustainable Homes

The Code for Sustainable Homes (the Code) is an environmental assessment method for rating and certifying the performance of new homes. It is a national standard for use in the design and construction of new homes with a view to encouraging continuous improvement in sustainable home building. The Code is based on EcoHomes®.

It was launched in December 2006 with the publication of 'Code for Sustainable Homes: A stepchange in sustainable home building practice' (Communities and Local Government, 2006), and became operational in England from April 2007.

The Code for Sustainable Homes covers nine categories of sustainable design. Each category includes a number of environmental issues. Each issue is a source of impact on the environment which can be assessed against a performance target and awarded one or more credits. Performance targets are more demanding than the minimum standards needed to satisfy Building Regulations or other legislation. They represent good or best practice, are technically feasible, and can be delivered by the building industry. The issues and categories are as follows:

- Energy & CO2 Emissions
  - Dwelling Emission Rate
  - Building Fabric
  - Internal Lighting
  - Drying Space
  - Energy Labelled White Goods
  - External Lighting
  - Low or Zero Carbon Technologies
  - Cycle Storage
  - Home Office
- Water
  - Internal Water Use
  - External Water Use
- Materials
  - Environmental Impact of Materials
  - Responsible Sourcing of Materials - Basic Building Elements
  - Responsible Sourcing of Materials - Finishing Elements
- Surface Water Run-off
  - Management of Surface Water Run-off from the Development
  - Flood Risk
- Waste
  - Storage of Non-Recyclable Waste and Recyclable Household Waste
  - Construction Site Waste Management
  - Composting
- Pollution
  - Global Warming Potential of Insulants
  - NOx Emissions

- Health & Wellbeing
  - Daylighting
  - Sound Insulation
  - Private Space
  - Lifetime Homes
- Management
  - Home User Guide
  - Considerate Constructors Scheme
  - Construction Site Impacts
  - Security
- Ecology
  - Ecological Value of Site
  - Ecological Enhancement
  - Protection of Ecological Features
  - Change in Ecological Value of Site
  - Building Footprint

The Code assigns one or more performance requirements (assessment criteria) to all of the above environmental issues. When each performance requirement is achieved a credit is awarded (with the exception of the four mandatory requirements which have no associated credits). The total number of credits available to a category is the sum of credits available for all the issues within it.

Mandatory minimum performance standards are set for some issues. For four of these, a single mandatory requirement is set which must be met, whatever Code level rating is sought. Credits are not awarded for these issues. Confirmation that the performance requirements are met for all four is a minimum entry requirement for achieving a level 1 rating. The four un-credited issues are:

- Environmental Impacts of Materials
- Management of Surface Water Run-off from Developments
- Storage of Non-Recyclable Waste and Recyclable Household Waste
- Construction Site Waste Management

If the mandatory minimum performance standard is met for the four un-credited issues, four further mandatory issues need to be considered. These are agreed to be such important issues that separate Government policies are being pursued to mitigate their effects. For two of these, credits are awarded for every level of achievement recognised within the Code, and minimum mandatory standards increase with increasing rating levels.

The two issues with increasing mandatory minimum standards are:

- Dwelling Emission Rate
- Indoor Water Use

For one issue a mandatory requirement at Level 5 or 6:

- Fabric Energy Efficiency

The final issue with a mandatory requirement for Level 6 of the Code is:

- Lifetime Homes

Further credits are available on a free-choice or tradable basis from other issues so that the developer may choose how to add performance credits (converted through weighting to percentage points) achieve the rating which they are aiming for.

The environmental impact categories within the Code are not of equal importance. Their relative value is conveyed by applying a consensus-based environmental weighting factor (see details below) to the sum of all the raw credit scores in a category, resulting in a score expressed as percentage points. The points for each category add up to 100.

The weighting factors used in the Code have been derived from extensive studies involving a wide range of stakeholders who were asked to rank (in order of importance) a range of environmental impacts. Stakeholders included international experts and industry representatives.

It is also important to note that achieving a high performance in one category of environmental impact can sometimes result in a lower level of performance for another. For instance, if biomass is used to meet heating demands, credits will be available for performance in respect of energy supplied from a renewable source, but credits cannot be awarded for low NOX emission. It is therefore impossible to achieve a total percentage points score of 100.

The Code uses a rating system of one to six stars. A star is awarded for each level achieved. Where an assessment has taken place by where no rating is achieved, the certificate states that zero stars have been awarded:

Code Levels	Total Points Score (Equal to or Greater Than)
<b>Level 1</b> ★☆☆☆☆☆	<b>36 Points</b>
<b>Level 2</b> ★★☆☆☆☆	<b>48 Points</b>
<b>Level 3</b> ★★☆☆☆☆	<b>57 Points</b>
<b>Level 4</b> ★★★☆☆☆	<b>68 Points</b>
<b>Level 5</b> ★★★☆☆☆	<b>84 Points</b>
<b>Level 6</b> ★★★★★★	<b>90 Points</b>

Formal assessment of dwellings using the Code for Sustainable Homes may only be carried out using Certified assessors, who are qualified 'competent persons' for the purpose of carrying out Code assessments.

### Energy & CO2 Emissions

#### ENE 1:Dwelling Emission Rate

##### Available Credits:10

**Aim:** To limit CO2 emissions arising from the operation of a dwelling and its services in line with current policy on the future direction of regulations.

#### ENE 2:Fabric Energy Efficiency

##### Available Credits:9

**Aim:** To improve fabric energy efficiency performance thus future-proofing reductions in CO2 for the life of the dwelling.

#### ENE 3:Energy Display Device

##### Available Credits:2

**Aim:** To promote the specification of equipment to display energy consumption data, thus empowering dwelling occupants to reduce energy use.

#### ENE 4:Drying Space

##### Available Credits:1

**Aim:** To promote a reduced energy means of drying clothes.

#### ENE 5:Energy Labelled White Goods

##### Available Credits:2

**Aim:** To promote the provision or purchase of energy efficient white goods, thus reducing the CO2 emissions from appliance use in the dwelling.

#### ENE 6:External Lighting

##### Available Credits:2

**Aim:** To promote the provision of energy efficient external lighting, thus reducing CO2 emissions associated with the dwelling.

#### ENE 7:Low or Zero Carbon Technologies

##### Available Credits:2

**Aim:** To limit CO2 emissions and running costs arising from the operation of a dwelling and its services by encouraging the specification of low and zero carbon energy sources to supply a significant proportion of energy demand.

#### ENE 8:Cycle Storage

##### Available Credits:2

**Aim:** To promote the wider use of bicycles as transport by providing adequate and secure cycle storage facilities, thus reducing the need for short car journeys and the associated CO2 emissions.

#### ENE 9:Home Office

##### Available Credits:1

**Aim:** To promote working from home by providing occupants with the necessary space and services thus reducing the need to commute.

### Water

#### WAT 1:Indoor Water Use

##### Available Credits:5

**Aim:** To reduce the consumption of potable water in the home from all sources, including borehole well water, through the use of water efficient fittings, appliances and water recycling systems.

#### WAT 2:External Water Use

##### Available Credits:1

**Aim:** To promote the recycling of rainwater and reduce the amount of mains potable water used for external water uses.

### Materials

#### MAT 1:Environmental Impact of Materials

##### Available Credits:15

**Aim:** To specify materials with lower environmental impacts over their life-cycle.

#### MAT 2:Responsible Sourcing of Materials - Basic Building Elements

##### Available Credits:6

**Aim:** To promote the specification of responsibly sourced materials for the basic building elements.

#### MAT 3:Responsible Sourcing of Materials - Finishing Elements

##### Available Credits:3

**Aim:** To promote the specification of responsibly sourced materials for the finishing elements.

### Surface Water Run-off

#### **SUR 1:**Management of Surface Water Run-off from developments

##### **Available Credits:**2

**Aim:** To design surface water drainage for housing developments which avoid, reduce and delay the discharge of rainfall run-off to watercourses and public sewers using SuDS techniques. This will protect receiving waters from pollution and minimise the risk of flooding and other environmental damage in watercourses.

#### **SUR 2:**Flood Risk

##### **Available Credits:**2

**Aim:** To promote housing development in low flood risk areas, or to take measures to reduce the impact of flooding on houses built in areas with a medium or high risk of flooding.

### Waste

#### **WAS 1:**Storage of non-recyclable waste and recyclable household waste

##### **Available Credits:**4

**Aim:** To promote resource efficiency via the effective and appropriate management of construction site waste.

#### **WAS 2:**Construction Site Waste Management

##### **Available Credits:**3

**Aim:** To promote resource efficiency via the effective and appropriate management of construction site waste.

#### **WAS 3:**Composting

##### **Available Credits:**1

**Aim:** To promote the provision of compost facilities to reduce the amount of household waste sent to landfill.

### Pollution

#### **POL 1:**Global Warming Potential of Insulants

##### **Available Credits:**1

**Aim:** To promote the reduction of emissions of gases with high GWP associated with the manufacture, installation, use and disposal of foamed thermal and acoustic insulating materials.

#### **POL 2:**NOx Emissions

##### **Available Credits:**3

**Aim:** To promote the reduction of nitrogen oxide (NOX) emissions into the atmosphere.

### Health & Wellbeing

#### **HEA 1:**Daylighting

##### **Available Credits:**3

**Aim:** To promote good daylighting and thereby improve quality of life and reduce the need for energy to light the home.

#### **HEA 2:**Sound Insulation

##### **Available Credits:**4

**Aim:** To promote the provision of improved sound insulation to reduce the likelihood of noise complaints from neighbours.

#### **HEA 3:**Private Space

##### **Available Credits:**1

**Aim:** To improve quality of life by promoting the provision of an inclusive outdoor space which is at least partially private.

#### **HEA 4:**Lifetime Homes

##### **Available Credits:**4

**Aim:** To encourage the construction of homes that are accessible and easily adaptable to meet the changing needs of current and future occupants.

## Management

### MAN 1:Home User Guide

#### Available Credits:3

**Aim:** To promote the provision of guidance enabling occupants to understand and operate their home efficiently and make the best use of local facilities.

### MAN 2:Considerate Constructors Scheme

#### Available Credits:3

**Aim:** To promote the environmentally and socially considerate, and accountable management of construction sites.

### MAN 3:Construction Site Impacts

#### Available Credits:2

**Aim:** To promote construction sites managed in a manner that mitigates environmental impacts.

## Management

### MAN 4:Security

#### Available Credits:2

**Aim:** To promote the design of developments where people feel safe and secure- where crime and disorder, or the fear of crime, does not undermine quality of life or community cohesion.

## Ecology

### ECO 1:Ecological value of site

#### Available Credits:1

**Aim:** To promote development on land that already has a limited value to wildlife, and discourage the development of ecologically valuable sites.

### ECO 2:Ecological enhancement

#### Available Credits:1

**Aim:** To enhance the ecological value of a site.

### ECO 3:Protection of ecological features

#### Available Credits:1

**Aim:** To promote the protection of existing ecological features from substantial damage during the clearing of the site and the completion of construction works.

### ECO 4:Change in ecological value of site

#### Available Credits:4

**Aim:** To minimise reductions and promote an improvement in ecological value.

### ECO 5:Building footprint

#### Available Credits:2

**Aim:** To promote the most efficient use of a building's footprint by ensuring that land and material use is optimised across the development.
