Legal Notice and Disclaimer

This Environmental Due Diligence report (the "Report") has been prepared by CBRE Limited ("CBRE") exclusively for Canada Life European Real Estate Limited' (the "Client") in accordance with the terms of engagement entered into between CBRE and the client dated 02 November 2017 ("the Instruction"). The Report is confidential to the Client and any other Addressees named herein and the Client and the Addressees may not disclose the Report unless expressly permitted to do so under the Instruction.

Where CBRE has expressly agreed (by way of a reliance letter) that persons other than the Client or the Addressees can rely upon the Report (a "Relying Party" or "Relying Parties") then CBRE shall have no greater liability to any Relying Party than it would have if such party had been named as a joint client under the Instruction.

CBRE's maximum aggregate liability to the Client, Addressees and to any Relying Parties howsoever arising under, in connection with or pursuant to this Report and/or the Instruction together, whether in contract, tort, negligence or otherwise shall not exceed the lower of:

- (i) 25% of the value of the property to which the Instruction relates; or
- (ii) £1 million (five million Pounds).

Subject to the terms of the Instruction, CBRE shall not be liable for any indirect, special or consequential loss or damage howsoever caused, whether in contract, tort, negligence or otherwise, arising from or in connection with this Report. Nothing in this Report shall exclude liability which cannot be excluded by law.

If you are neither the Client, an Addressee nor a Relying Party then you are viewing this Report on a non-reliance basis and for informational purposes only. You may not rely on the Report for any purpose whatsoever and CBRE shall not be liable for any loss or damage you may suffer (whether direct, indirect or consequential) as a result of unauthorised use of or reliance on this Report. CBRE gives no undertaking to provide any additional information or correct any inaccuracies in the Report.

None of the information in this Report constitutes advice as to the merits of entering into any form of transaction.

If you do not understand this legal notice then it is recommended that you seek independent legal advice.

Executive Summary

Key Point Item	Status Comment
Introduction	The site, which occupies an area of approximately 0.33 hectares, is situated in the East Bedfont area of south-west London and comprises a three-storey commercial building, dating from the late 1990s. The building footprint occupies an estimated 30% of the site area. The remainder of the site is given over to hard surfaced access roadways and parking (c.60%) and perimeter landscaping (c.10%). No significant potential sources of ground contamination have been identified on site currently. It is proposed to convert the building to a residential end use. Following conversion the site shall provide 44 apartments, with no significant external alterations are proposed.
Environmental Setting	The site is considered to be situated in an area of moderate to high sensitivity with respect to groundwater resources due to the underlying highly productive River Terrace Deposits (RTD, Principal Aquifer), albeit groundwater is not abstracted for potable supply in the vicinity of the site. The low permeability London Clay, underlying the RTD, would be expected to restrict the downward migration of contamination (if present) to the deeper Principal Chalk Aquifer. The site is considered to be situated in an area of low to moderate sensitivity with respect to surface water resources due to the distance to, and man-made nature of, the Langford River and Duke of Northumberland's River (c.260m and 280m north-west).
Site History	Historically, the site comprised an area of woodland and anticipated agricultural land from at least the late 19th Century until the construction of two buildings of anticipated residential or commercial use by the mid-1930s. The site remained in this configuration until the 1970s and the construction of a depot, with the redevelopment of the site to its current configuration in the late 1990s. Whilst the specific nature of activities undertaken at the depot have not been determined there are no tanks or significant manufacturing areas annotated on historical mapping that may suggest the presence of potentially significant sources of contamination. Furthermore, regulatory records do not identify any significantly contaminative activities and an intrusive ground investigation completed prior to the redevelopment of the site to its current configuration, whilst limited in terms of scope and extent, did not record any positive evidence of significant contamination or elevated ground gas concentrations. Therefore, based on available information, it is considered that the historical uses of the site have a limited potential for contamination.
The Surrounds	The immediate surrounds have had a similar history to the subject site, generally comprising undeveloped agricultural/woodland from at least the 19th Century prior to the construction of mixed residential, commercial and industrial premises from the early/mid-20th century.

Executive Summary

Potentially contaminative land uses include factories, works, garages and depots. Additionally, a number of former mineral extraction pits in the immediate surrounding area have also been utilised as landfills. However, third party site investigation reports completed for land adjacent to the north and c.60m north-west (which was subject to historic landfilling activities) did not identify significant site-wide contamination or elevated ground gas concentrations. Furthermore, a number of the identified industrial land uses have since been redeveloped, which would be anticipated to have involved a degree of ground improvement and thereby reducing the potential for significant contamination to remain.

Overall Assessment Based on the findings of the Phase I Environmental Assessment and the formulation of a preliminary Conceptual Model (CM) no plausible pollutant linkages have been identified in the context of the proposed residential end use of the site. CBRE considers that the site represents a **low risk** of representing a significant risk to human health and/or controlled waters during and following the proposed change of use.

Additional Investigation & Testing No further assessment or risk mitigation works are considered to be required in the context of the proposed change of use.

No additional areas of landscaping (e.g. public open space/communal gardens) are to be created as part of the proposed change of use. In the event that these are to be incorporated at a future date, it is recommended that a suitable thickness of certified clean-fill material should be used.

1.0 Introduction

Site Layout Plan

(©Landmark Information Group Limited 2018)

Site Location Plan

(©Landmark Information Group Limited 2018)

1.1 Background

The Environmental Risk team of CBRE Ltd. (CBRE) was instructed by Canada Life European Real Estate Limited to undertake a Phase I Environmental Assessment of Bedfont Cross, Stanwell Road, London, TW14 8NX (the “site”).

The site covers an area of approximately 0.33 hectares and supports an office building, known as Bedfont Cross, that is arranged over ground and two upper levels and dates from the late 1990s.

The assessment is required to support the Client’s proposed conversion of the site from office (use class B1a) to residential (use class C3) use and specifically to obtain prior approval from the London Borough of Hillingdon (LBH) with respect to matters associated with land contamination and the status of the site under Part 2A of the Environmental Protection Act 1990.

It is understood that it is proposed to convert the building to a residential end use. Following conversion the site shall provide 44 apartments, with no significant external alterations are proposed.

The report should be read in conjunction with the report qualifications attached hereto in Appendix C.

1.2 Objective

The purpose of the assessment is to assess the potential for soil and/or groundwater contamination, both at and in vicinity of the site, and assess its significance in terms of risks to human health and/or controlled waters and potential liabilities in the context of the proposed change of use of the site from commercial to residential.

1.3 Scope of Works

The scope of works for the review was as follows:

- site reconnaissance by an environmental consultant;
- review of historic data for the site and surroundings, including historic Ordnance Survey (OS) maps of the area;

1.0 Introduction

- review of site geology, hydrogeology and hydrology from geological (British Geological Survey (BGS) Sheet 270, South London) and the Environment Agency (EA) aquifer designation system maps (on-line);
- review of third party environmental database (Landmark) and EA geographical information system maps (on-line) regarding licenses, discharge consents, pollution incidents and waste management facilities on, and in, the vicinity of the site; and
- correspondence and/or discussions with the Regulatory Authorities.

No sampling or analysis of soils, waters or other material was carried out for the purpose of this assessment.

2.0 The Site & Surrounds

2.1 Introduction

A review of current land uses was completed through a site inspection conducted by Ed Blackburn of CBRE on 13 April 2018 and a review of information available in the public domain. This has enabled an assessment to be made of the potential for ground contamination associated with current activities, both on site and in the surrounding area. Discussions were held with facilities management personnel employed by the tenant.

2.2 The Site

The site is located to the north of Stanwell Road in the East Bedfont area of south-west London, at National Grid Reference TQ 081 738. The site lies at an approximate elevation of 21m above ordnance datum (AOD), as taken from a benchmark level located on Stanwell Road to the south-west. Topographically, the site and surrounding area appear to be predominantly level.

The site, which is irregular in plan and occupies a total area of approximately 0.33 hectares (0.81 acres), houses Bedfont Cross, a purpose-built office building that is arranged over ground and two upper floors. The building is occupied in its entirety by Merck Serono for office purposes, with the accommodation including a double height reception area, open plan and cellular office/meeting space, a staff canteen and ancillary welfare facilities. Plant is housed within a roof-level plant room, with a chiller also located within an external brick enclosure.

External areas of the site comprise block paved, tarmacadam and concrete surfaced access roadways and parking areas, including a twin-deck parking area in the north-west of the site. The lower and upper levels of this parking area are located approximately 1.3m below and above the prevailing ground level, respectively. A plant enclosure and secure electricity sub-station (ESS) are located adjacent to the south of the parking deck. A paved walkway surrounds the building, with areas of landscaping, comprising grass, shrubs and semi-mature trees, predominantly located to the southern and eastern perimeters of the site. The building footprint occupies an estimated 30% of the site area. The remainder of the site is given over to hard surfaced access roadways and parking (c.60%) and perimeter landscaping (c.10%).

Access ramps for twin-deck car park
(CBRE 2018)

The Site & Surrounds

2.3 Key Observations from the Site Reconnaissance

A summary of the key observations made during the site reconnaissance completed by CBRE is provided below:

- The site contacts were unaware of any current or former underground or above ground bulk storage of fuel and/or hazardous material on site. No evidence of any underground tanks (e.g. unexplained manhole covers, vents, fill points etc.) was noted at the time of the reconnaissance. Small quantities (<5L) of standard cleaning/maintenance products (e.g. paint, detergents etc.) are stored at various locations throughout the building. No issues were identified associated with the storage of these materials and they are not anticipated to comprise a potentially significant source of ground contamination.
- Only general, recyclable and food waste is routinely produced as a result of tenant activities, with waste materials stored within dedicated receptacles prior to collection by the tenant's appointed waste contractor. No issues were identified associated with the generation and storage of waste materials.
- An asbestos refurbishment survey was completed for the tenant in September 2014¹, which did not record the presence of any asbestos containing materials (ACM) within the building. CBRE have not completed a review of the technical adequacy or scope of the survey as part of this assessment.
- The site is provided with mains power supply. As noted above, an ESS is located within a secure building adjacent to the parking deck. The ESS is owned and operated by the Regional Electricity Company (REC) and no access was provided during the site reconnaissance. Nevertheless, the ESS is anticipated to have been installed during the construction of the existing building and therefore the potential for polychlorinated biphenyl (PCB) to be present within oil coolant (where present) is negligible².
- The buildings on site are connected to mains water supply (i.e. there are no groundwater abstraction wells operated on site). Sanitary wastewater and surface water run-off (from the roofs, access, parking and servicing areas) are generated on site. No trade effluent is currently produced. A drainage plan has not been provided but the site contacts indicated that sanitary wastewater and surface water run-off discharge off-site to public sewer located beneath Stanwell Road. The site contacts were not aware of any oil-water interceptors within the drainage system and no evidence of any such features was noted at the time of the reconnaissance (i.e. three consecutive manhole covers, vents etc.).
- No suspected Japanese Knotweed, Giant Hogweed or Himalayan Balsam, as types of invasive weeds, were identified on site, although a habitat survey was not completed as part of this assessment.
- The site contacts were unaware of any environmental issues associated with the site, or surrounding properties.

¹ 'Localised Asbestos Refurbishment Survey of Merck Serono Ltd'. City Environmental Services UK for Merck Serono (reference CES 530001, 11/09/2014)

² The manufacture and use of PCBs within new equipment was prohibited in the UK in 1981.

The Site & Surrounds

2.4 The Surrounds

The site is located within an area of mixed light industrial, aviation, residential and agricultural use. A number of light industrial units are located to the north and west of the site, including a number that support freight handling, catering and aircraft maintenance/repair activities associated with Heathrow airport. The airport itself is located from c.450m north. Land beyond Stanwell Road to the south is in agricultural use, with a water reclamation works c.750m south-west. Residential housing is located from c.50m south-east

Bedfont Lakes, c.840m south, is a designated Local Nature Reserve (LNR). There are no other environmentally sensitive land uses, e.g. Sites of Special Scientific Interest (SSSI) Special Areas of Conservation (SAC), Local Nature Reserves, or Areas of Outstanding Natural Beauty (AONB) etc., located within a 1km radius.

2.5 Environmental Databases

According to a publicly available third-party environmental database there are no records of historical/operational landfills on site, with three historical landfills recorded within a 250m radius (i.e. within the Planning Consultation Zone). The records relate to landfills located c.35m and c.175m east, known as Stanwell Road and Bedfont Close, respectively, and c.60m north-west, known as British Airways Catering. The nature of the wastes deposited within the landfills has not been confirmed. Stanwell Cross is indicated to have operated from 1934 to 1946, whilst Bedfont Close operated from 1866 to 1945. The British Airways Catering site operated from 1955, albeit the date on which waste deposition ceased has not been confirmed. Where the landfills received putrescible/degradable wastes the potential for landfill gas (principally methane and/or carbon dioxide) and/or leachate (contaminated groundwater) to be generated that could migrate onto and impact the subject site cannot be discounted.

A ground investigation undertaken at the British Airways Catering landfill as part of the recent construction of the current light industrial units³ did not identify significant quantities of putrescible waste. Fill materials, predominantly comprising demolition rubble, were generally encountered to a depth of up to 1.6m below ground level (bgl), with deeper areas of Made Ground (MG), including some rubber and metal fragments, encountered to >3mbgl locally in the south/south-west (i.e. approximately 110m north-west of the site). Ground gas monitoring completed as part of the investigation did not identify any significant elevated gas concentrations or flow rates.

Information held by the LBH indicates that a ground investigation(s) completed in the area of the Bedfont Close landfill encountered fill material, predominantly comprising ash, organic material, brick, glass, metal, wood, topsoil, tarmac and china, to a depth of 3.2mbgl. A degree of remediation works are understood to have been completed, comprising the removal of contaminated MG and replacement by clean fill, possibly in relation to the construction of the existing residential housing.

³ Phase 2 Geo-environmental Investigation and Assessment Scylla Road, Heathrow - Phase 1. Capita Symonds Structures for Airport Property Partnership (Reference SS017966, Revision A, 17/06/11).

The Site & Surrounds

It is noted that all of the historic landfills identified in the vicinity of the site have been redeveloped, including to support residential housing.

There are no Part A or Part B Environmental Permits held within a 250m radius, nor are there any records of Environmental Permits for a waste management facility or the keeping, use and disposal of radioactive substances⁴ on site. Similarly, there are no records of operational or obsolete petrol filling stations (PFS) within 250m or records of Control of Major Accident Hazards (COMAH), Notification of Installations Handling Hazardous Substances (NIHHS) or Planning Hazardous Substances Consents within 340m (i.e. the Health and Safety Executive consultation zone).

2.4 Potential for Current Contamination

No significant potential sources of contamination have been identified from the current commercial use of the site as a commercial office building.

The site is located within an area of mixed residential, agricultural and light industrial end uses. Additionally, three historic landfills have been identified within a 250m radius. Potential contaminants associated with off-site light industrial and landfilling activities depend on the exact nature of the works undertaken; however, in general terms may include petroleum hydrocarbons, polycyclic aromatic hydrocarbons (PAH), metals, solvents, asbestos, ground gas and leachate. The potential for the generation of ground gas and/or leachate from the off-site landfills shall depend upon the nature of the wastes deposited, with site investigation information suggesting that the potential for contamination to be present in some areas of tipping is limited.

⁴ Due to public security restrictions, certain information on closed or mobile radioactive substance authorisations has been removed from the public register.

3.0 Geology, Hydrogeology & Hydrology

3.1 Introduction

Desk-based research of the local geology, hydrogeology and hydrology was carried out in order to establish the potential migration pathways (onto or away from the site) and likely receptors (i.e. the surface water and groundwater sensitivity of the site area).

3.2 Geology

According to the BGS 1:50,000 Solid and Drift map of the area (BGS Sheet 270, South London) and published BGS borehole logs for the site and immediate surrounding area⁵ the site is underlain by superficial deposits of Taplow Gravel (River Terrace Deposits (RTD), sand and gravel, typically <10m thick), which is in turn underlain by the solid geology of the London Clay (clay, silt and locally sandy, locally recorded to a thickness of c.78m). Given the developed location of the site, the ground will have been disturbed and MG should be anticipated beneath the site and surrounding area.

- The London Clay is sequentially underlain by the following geology:
- Lambeth Group (mottled clays with sand and pebble beds, generally 22-28m thick); overlying
- The Chalk Group (white chalk with flint, to depth).

A third party ground investigation completed for the site (see Section 4) encountered ground conditions that were broadly consistent with published mapping. The site was noted to be underlain by variable Made Ground deposits (MG, i.e. fill material) that comprised sandy clay and clay bound gravel with hardcore, brick, concrete and 'stones', along with occasional pieces of wood and ash. The MG generally extended to depths of 1.7 – 2.4m below ground level (bgl), although in the north-west of the site it extended to just 0.5m bgl. The MG overlay natural deposits comprising a generally thin layer of sandy, gravelly clay (typically <0.5m) and sand and gravel (locally clayey) that is anticipated to comprise the RTD. These deposits extended to c.4.0 – 4.5m bgl, beneath which was brown, becoming grey clay indicative of the solid geology of the London Clay. These deposits were not proven beyond the maximum depth of investigation (20m bgl).

The site is located in a lower probability radon area, as less than 1% of residential properties are above the action level of 200Bq/m³ for Radon set by the Public Health England (formerly the Health Protection Agency). No radon protection measures are considered necessary by the BGS in new dwellings.

3.3 Hydrogeology

The superficial deposits of the RTD are classified by the Environment Agency (EA) as a Principal Aquifer. A Principal Aquifer is a formation capable of supporting large scale abstractions for potable water supply and other purposes. No discernible groundwater strikes were recorded during the ground investigation completed on site in 1996, although other investigations completed for the wider surrounds recorded the presence of groundwater within the RTD at depth of 3 - 4m bgl.

⁵ Contains BGS materials © NERC (2018)

Geology, Hydrogeology & Hydrology

Groundwater within the superficial RTD is anticipated to be towards the east/south-east, in line with the Thames river valley.

Groundwater is also anticipated at depth within the Chalk Group, which has a high degree of secondary permeability and represents a major groundwater resource. Consequently, the Chalk Group is also classified as a Principal Aquifer by the EA.

The London Clay is of low permeability and is unlikely to be water bearing in nature. The London Clay is classified by the EA as Unproductive Strata, which is a formation of negligible permeability that can only support very minor abstractions (if any). The London Clay (mapped at >70m thick) would be expected to restrict the downward migration of mobile site-derived contamination (if any present) to the underlying Principal Chalk Aquifer.

The shallow gravel aquifer (termed the 'Lower Thames Gravels') is designated as a groundwater body under the Water Framework Directive (WFD) that has been classified as being of 'Good' chemical status by the EA under the River Basin Management Plan (RBMP) devised for the Thames catchment.

According to a publicly available third-party environmental database, there are three licensed groundwater abstractions within a 1km radius of the site that are all held by the same individual, c.690 – 755m south-west, for spray irrigation purposes.

According to an EA data source the site is not situated within a currently designated groundwater Source Protection Zone (SPZ).

3.4 Hydrology

The nearest identified significant surface watercourses to site are the Longford River and Duke of Northumberland's River, which flow in a general east to west direction approximately 260m and 280m north-west respectively. The course of both the Duke of Northumberland's River and, to a lesser extent, Longford River has been altered over time to accommodate development of the surrounding area, most notably Heathrow Airport, and are consequently classified as Heavily Modified Water Bodies (HMWB). However, the channels are not believed to be lined and groundwater within the RTG may be in hydraulic continuity with these watercourses. A number of other un-named surface water drains are located from c.400m south-west and a network of flooded gravel pits, known as Bedfont Lakes, are located from c.900m south.

The ecological potential and chemical water quality of both the Langford River and Duke of Northumberland's River have been classified by the EA as 'moderate' and 'good' respectively under their RBMP formulated for the Thames catchment.

According to the EA 'Risk of Flooding from Rivers and Sea Map', the site has a 'very low' risk of flooding from rivers or the sea, with an annual chance of flooding less than 1 in 1,000 (0.1%). For planning and development purposes, and according to the EA 'Flood Map for Planning (Rivers and Sea)', the site is located within Flood Zone 1 (Low Probability).

According to a publicly available third-party environmental database there are no licensed surface water abstractions within a 1km radius of the site.

Geology, Hydrogeology & Hydrology

There are no records of any pollution incidents to controlled waters/substantiated pollution incidents relating to the subject site, with one recorded within a 250m radius. This incident occurred c.225m north-west in November 1989, and involved the discharge of unknown chemicals to an unspecified water body. The incident was categorised by the EA as of 'minor' impact (Category 3).

3.5 Significance of Geology, Hydrogeology and Hydrology

The site is considered to be situated in an area of moderate to high sensitivity with respect to groundwater resources due to the underlying highly productive Principal Aquifer of the RTD, albeit groundwater is not abstracted for potable supply in the vicinity of the site. The low permeability London Clay, underlying the RTG, would be expected to restrict the downward migration of contamination (if present) to the deeper Principal Chalk Aquifer.

Shallow groundwater within the RTD, where present, may provide a mechanism for shallow mobile contaminants (if any present) to migrate onto the site from off-site sources, or away from the site onto third-party land. The direction of shallow groundwater flow is anticipated to be towards the north/north-west.

The site is considered to be situated in an area of low to moderate sensitivity with respect to surface water resources due to the distance to, and man-made nature of, the Langford River and Duke of Northumberland's River (c.260m and 280m north-west).

4.0 Site History

4.1 Introduction

A review of the previous land uses at the site was carried out by inspecting historical maps and through contact with the Regulatory Authorities. This has enabled an assessment to be made of the potential for contamination associated with former activities, both on-site and in the surrounding areas.

4.2 Review of Historical Maps

The historical development of the site is summarised below. Selected extracts of historical OS maps are attached hereto at Appendix B.

The earliest available mapping (1865) indicates that the site predominantly comprised wooded land, extending off-site to the east, with the western part of the site appearing to comprise an undeveloped area of agricultural land. A road also traversed the south-eastern corner of the site. By 1934 the site had been redeveloped to support a building of anticipated residential use in the west and a further smaller unlabelled structure of residential/commercial use in the east, along with Stanwell Road traversing the southern part of the site. By 1962 the building in the west was labelled as Court Lodge and had been extended, whilst the building in the east had been extended, with an apparent yard/parking area to its west. By 1978 the site had been redeveloped to support a depot, that comprised an 'L' shaped building in the centre-east and an apparent open yard area occupying the majority of the remainder of the site. A small rectangular feature/building was located in the centre of the yard area. The site had been redeveloped to its current configuration by 1999.

The environmentally pertinent historical uses from the surrounding area (<250m) have been summarised in the table below:

SURROUNDING SITE USE	DATES	LOCATION
Factory/Plastic Containers Factory <i>then</i> logistics/distribution depot	pre 1962 to c.1996 c.1996 to present	adjacent north
Works <i>then</i> Garage and Agricultural Implements Repair Works/Works <i>then</i> Commercial vehicle garage/car hire depot	pre 1961 to pre 1972 pre 1972 to post 1992 post 1992 to present	c.35m east
Heathrow Airport Depot	pre 1992 to present	c.75m west
Flight Catering Centre <i>then</i> Aero Engineering Depot/Logistics Depot	pre 1989 to c.2012 c.2012 to present	c.100m north-west
Factory <i>then</i> Air Freight Depot/Warehouse <i>then</i> Warehouse <i>then</i> Vacant land/car park	pre 1961 to pre 1967 pre 1967 to pre 1986 pre 1986 to c.2012 c.2012 to present	c.150m north
Depot	pre 1978 to present	c.175m west

Site History

4.3 Regulatory Authority Information

Planning Department

A planning history for the site has been obtained from the Planning Department of the LBH. The existing building was developed on site under an outline application for the 'Erection of an office building with associated car parking and landscaping' granted on 27 December 1995 (planning reference 50395/95/1651), with a subsequent application approved for 'Erection of a three storey office building with decked and surface car parking (including erection of an electricity sub-station) and alterations to existing access and landscaping' granted on 02 October 1997 (planning application reference 50395/A/97/1297). Only the decision notice relating to the consent granted in October 1997 was available to view online, which was not granted subject to any conditions pertaining to contaminated land.

Planning records indicate that the site was formerly known as Airspeed House, which is anticipated to have been developed in the 1970s.

No other environmentally pertinent planning applications were identified from LBH's planning records. It is noted that the site formerly fell within the boundaries of the London Borough of Hounslow; however, Hounslow Council have been unable to provide any further planning information relating to the subject site.

Environmental Health Department

The Environmental Health Department of the LBH has confirmed that the site has not been designated as Contaminated Land under Part 2A of the Environmental Protection Act 1990, nor is further action under Part 2A likely.

Building Control Department

The Building Control Department of the LBH have confirmed that plans for the development of the current building were approved in June 1998 (reference 50395/B/97/4808). A review of files held by the department identified that an intrusive site investigation was completed in 1996 prior to the redevelopment of the site to its current configuration. The findings of this investigation are discussed in further detail in Section 4.4 below.

Environment Agency

A number of EA data sources have been reviewed by CBRE as part of the assessment. No issues have been identified that warrant further consultation.

Petroleum Licensing Authority

The Petroleum Licensing Officer at London Fire and Emergency Planning Authority holds no records of petroleum storage at the site currently, or in the past.

4.4 Third Party Investigations

As noted above, an intrusive site investigation was undertaken in November 1996 prior to the redevelopment of the site to its current configuration by Soil Consultants Limited (reference 2136/SEQ, 29 November 1996). The investigation included the drilling of five cable percussion boreholes (denoted BH1 – 5) to a maximum depth of 20m bgl. At the time of the investigation the site comprised a vacant plot that

Site History

had been cleared of all buildings, with a stockpile of 'fly tipped clay spoil' present on site.

No visual or olfactory evidence of contamination was noted within the exploratory holes, with the LBH file records the analytical results for four samples of the flytipped material that were submitted for chemical analysis for a range of parameters, including metals, cyanide, phenol, boron, toluene extractable matter (TEM)⁶ and polycyclic aromatic hydrocarbons (PAH). The Soil Consultants report also suggests that analytical testing was completed on soil samples taken from the boreholes drilled as part of the investigation, although no corresponding results are reported within the copy of the report held by the LBH. The analytical results did not record any significant elevated contaminant concentrations and Soil Consultants state that the flytipped material and below ground clay fill was 'essentially not contaminated'.

The intrusive investigation also included the installation of ground gas monitoring wells within a number of the drilled boreholes, with three monitored (Nos. 1, 2 and 5) during a single round of post-investigation monitoring. Whilst the installation details of the wells is not known (i.e. it is not clear what strata they were installed to monitor). No significantly elevated concentrations of methane (<10 parts per million (ppmV)) or carbon dioxide (all <0.1% by volume (v/v)) were recorded, or depleted oxygen levels (all >19.6% v/v). Furthermore, no positive gas flow rates were recorded (all <0.01 l/min).

Due to the findings of the investigation Soil Consultants made no recommendations relating to the mitigation of risks associated with ground contamination.

4.5 Potential for Historical Contamination

Historically, the site comprised an area of woodland and anticipated agricultural land from at least the late 19th Century until the construction of two buildings of anticipated residential or commercial use by the mid-1930s. The site remained in this configuration until the 1970s and the construction of a depot, with the redevelopment of the site to its current configuration in the late 1990s. Whilst the specific nature of activities undertaken at the depot have not been determined, there are no tanks or significant manufacturing areas annotated on historical mapping that may suggest the presence of potentially significant sources of contamination. Furthermore, regulatory records do not identify any significantly contaminative activities or sources, and an intrusive ground investigation completed prior to the redevelopment of the site to its current configuration, whilst limited in terms of scope and extent, did not record any positive evidence of significant contamination or elevated ground gas concentrations. Therefore, based on available information, it is considered that the historical uses of the site have a limited potential for contamination. Contaminants that may be present include petroleum hydrocarbons associated with the operation and maintenance of

⁶ TEM comprises a basic analytical test to determine the presence of organic contamination in a sample that was historically frequently utilised to indicate the presence of petroleum hydrocarbons. However, the presence of naturally occurring organic material can also result in elevated concentrations being reported.

Site History

machinery and polycyclic aromatic hydrocarbons (PAH), metals and asbestos associated with general MG.

The immediate surrounds have had a similar history to the subject site, generally comprising undeveloped agricultural/woodland from at least the 19th Century prior to the construction of mixed residential, commercial and industrial premises from the early/mid-20th Century. Potentially contaminative land uses include factories, works, garages and depots. Additionally, a number of former mineral extraction pits have also been utilised as landfills.

Potential contaminants that may be present associated with surrounding historical land uses include petroleum hydrocarbons, PAH, volatile organic compounds (VOC), asbestos, ground gas (methane and carbon dioxide) and leachate (contaminated groundwater). However, third party site investigation reports completed for the adjacent site to the north (formerly occupied by a plastics containers factory) in 1996 and c.50m north-west (which was subject to historic landfilling activities) in 2011⁷ (as summarised in Section 2) did not identify the presence of significant site-wide contamination or ground gas concentrations. Furthermore, a number of the identified industrial land uses have since been redeveloped, which would be anticipated to have involved a degree of ground improvement and thereby reducing the potential for significant contamination to remain.

(reference LBH997, June 1996) and 'Phase II Geoenvironmental Investigation and Assessment, Scylla Road Heathrow – Phase 1', Capita Symonds (Structures) Ltd for Airport Property Partnership (reference SS017996-PE-11-175-R, 6 June 2011).

5.0 Conceptual Site Model

5.1 Introduction

In line with UK guidelines and based on the findings of the Phase I Environmental Assessment, a qualitative assessment of the risks associated with ground conditions at the site, has been undertaken in the formulation of a preliminary conceptual model (CM). This includes several scenarios, such as risk to future site users, building materials, users and occupants of neighbouring properties and ground and surface water.

A CM is an essential element of any site specific environmental risk assessment. In this context, it is often a simple representation of the hypothesised relationships between source, pathways and receptors. For the purpose of this report a preliminary CM has been developed based on the presentation and interpretation of information regarding the site, which has been gathered during the environmental report. This allows the identification of potential pollutant linkages and, therefore, an interpretation of the potential for significant harm and/or pollution of human health/controlled waters in relation to the site.

The site appears to have supported woodland/agricultural uses prior to the construction of two buildings of anticipated residential, or possible commercial, use by the mid 1930s. It was subsequently redeveloped to support a depot, known as Airspeed House, by the 1970s and whilst the potential for contamination to be present associated with the depot use, there is no positive evidence to suggest this (e.g. mapped tanks or manufacturing areas), with a previously completed ground investigation not identifying any significant evidence of contamination. Furthermore, no potentially significant sources of contamination have been identified associated with the current office use.

It is currently proposed to implement a change of use from the current office to a residential use to comprise a number of apartments. It is understood that no significant alterations to the fabric of the building or external areas will be undertaken as part of the proposed conversion.

5.2 Sources

Soil

A potential for significant contamination to be present associated with historical site uses has not been identified. However, there is the possibility for localised hotspots of contaminants to be present associated with the former depot use and/or general MG. Contaminants present associated with historical site uses include petroleum hydrocarbons, metals, PAH and asbestos.

Groundwater

Given the identified absence of significant sources of soil contamination the potential for shallow groundwater to be significantly impacted is considered to be limited. Shallow groundwater may be impacted by off-site sources of contamination, although ground investigations completed for land to the north and north-west (anticipated to be located hydraulically up-gradient of the subject site) did not record the presence of significant groundwater impact.

Ground Gas

Conceptual Site Model

No potentially significant sources of ground gas (e.g. evidence of infilled ground or waste deposition/landfills) have been identified on site, with a number of landfills identified in the wider surrounds. Ground gas monitoring completed on site, whilst limited in terms of scope, did not record any evidence of significant gas generation/migration. Similarly, monitoring completed in the wider surrounds has not identified significantly elevated ground gas concentrations, including in the area of the former areas of landfilling, that suggests significant gas generation is not occurring.

5.3 Receptors

The level of risk derived from contamination on site is determined by the nature of receptors susceptible to contamination and the pathways by which it may reach them. The key receptors identified in the context of the proposed residential end use are as follows:

- Construction and maintenance workers, including during redevelopment of the site;
- Future residents (private apartments);
- Uptake of contamination by plants/trees;
- Buildings and materials (i.e. concrete and water supply pipes);
- Users/residents of neighbouring properties;
- Groundwater beneath the site; and
- Nearby surface water bodies (Langford River/Duke of Northumberlands River)

5.4 Key Pathways

In order for a receptor to be at risk from a source of contamination, the receptor and source must be “linked” by a plausible migration pathway. Potential pathways between the sources and receptors are discussed in further detail below:

Direct Contact (i.e. oral/dermal) and Inhalation of Wind Blown Dust

- The potential for future site users to come into direct contact with contamination is only present within areas of ground floor level soft landscaping. As the proposed change of use is not anticipated to include private gardens, with the current predominance of hardstanding and limited extent of established (i.e. turfed/planted) perimeter landscaping to remain, the potential for exposure to any contaminants present via direct contact or the inhalation of wind blown dust is considered to be limited. Furthermore, in the event that additional areas of landscaping are proposed then the use of a suitable thickness of “clean” soil will provide appropriate mitigation for site users.
- It is not anticipated that extensive groundworks will be completed as part of the proposed change of use. In the event that hotspots of contamination are present within the shallow sub-surface the risks posed to those who may undertake construction/maintenance activities can be mitigated through the implementation of appropriate health and safety measures and use of personal protection equipment (PPE).

Conceptual Site Model

- The risk is considered to be **low** in the context of the proposed change of use.

Vertical Migration of Contaminants to Indoor Air from Soil and Shallow Groundwater (i.e. inhalation)

- No significant potential sources of ground gas or volatile organics have been identified on site, with ground gas monitoring, whilst limited in extent, not recording any significantly elevated concentrations of methane or carbon dioxide.
- The construction detail of the current building has not been confirmed but given its relatively recent construction it is anticipated that the floor slab will be integral and it is likely to have been constructed with a sub-slab damp proof membrane, which reduces the potential for the ingress and accumulation of gases/vapours.
- The risk is considered to be **low** in the context of the proposed change of use.

Uptake of Contaminants by Plants/Trees

- Where shallow soils beneath the site are impacted with phytotoxic metals (e.g. nickel, copper and zinc) this may inhibit future plant growth. However, no significant potential sources of phytotoxic metals have been identified from the current or former use of the site. Furthermore, no evidence of vegetation die-back has been observed on site and no additional areas of landscaped ground are proposed as part of the proposed change of use. Should new areas of landscaping be proposed then any risks associated with phytotoxic metals (if any present) can be mitigated by the use of suitable clean-fill soil.
- The risk is considered to be **low** in the context of the proposed change of use.

Permeation of Water Supply Pipes

- Certain contaminants, such as metals, phenols and light fraction hydrocarbons, have the potential, where present at elevated concentrations, to permeate plastic water supply pipes and affect water supplies. However, no potentially significant sources of those contaminants that may pose a risk to water supply pipes have been identified associated with current or historical site uses.
- The risk is considered to be **low** in the context of the proposed change of use.

Leaching to the Underlying Principal Aquifer

- The potential for significant leaching of contaminants to groundwater is only present within areas of soft landscaping. The site is predominantly surfaced with hardstanding, with only very limited areas of peripheral landscaping, and therefore the potential for infiltration of rainwater and subsequent leaching of contaminants from the shallow sub-surface to groundwater present at depth is considered to be limited. Furthermore, no significant sources of contamination have been identified that are likely to result in impact to groundwater present beneath the site.
- The risk is considered to be **low** in the context of the proposed change of use.

Leaching and Lateral Migration to Nearby Surface Water Bodies

Conceptual Site Model

- No significant potential sources of contamination have been identified associated with the former or current activities undertaken on-site. Furthermore, in the unlikely event that groundwater beneath the site is impacted with site derived contamination, given the distance of nearby surface water bodies (i.e. Longford River/Duke of Northumberland River)
- The risk is considered to be **low** prior to and following the proposed redevelopment of the site.

Preferential Migration On-site and Off-site of Mobile Contaminants within Shallow Groundwater, along Drainage Routes/Buried Services and Lateral Migration of Ground Gas and Volatile Vapours

- Risks to future site users and residents of neighbouring properties are primarily associated with the inhalation of volatile organics and/or ground gas through lateral migration within the unsaturated zone, and the ingestion of windblown dust from soft landscape areas.
- No significant potential sources of ground gas have been identified on site that may pose a risk to users of third party land. Furthermore, whilst potential sources of contamination have been identified in the surrounds (including recorded landfills), no evidence of significant gas generation or the presence of organic contaminants has been recorded in the immediate surrounding area.
- Additionally, and as noted above, the recent construction of the current building would be anticipated to reduce the potential for the ingress of gases/vapours, whilst the predominance of hardstanding/established vegetation on site and in the surrounds would be anticipated to prevent the wind blown migration of contaminated dust.
- The risk is considered to be **low** prior to and following the proposed change of use.

6.0 Conclusions & Recommendations

6.1 Conclusions

Based on the findings of the Phase I Environmental Assessment and the formulation of a preliminary Conceptual Model (CM) no plausible pollutant linkages have been identified in the context of the proposed residential end use of the site. CBRE considers that the site represents a **low risk** of representing a significant risk to human health and/or controlled waters in the context of the proposed change of use.

6.2 Recommendations

No further assessment or risk mitigation works are considered to be required in the context of the proposed change of use.

In the event that the excavation of ground is undertaken, appropriate working practices are formulated and implemented to ensure the management of potential risks to construction and/or maintenance workers.

No additional areas of landscaping (e.g. public open space/communal gardens) are to be created as part of the proposed change of use. In the event that these are to be incorporated at a future date, it is recommended that a suitable thickness of certified clean-fill material should be used.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Extracts of Historical Maps

Middlesex

Published 1865

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Middlesex

Published 1934

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Additional SIMs

Published 1978 - 1986

Source map scale - 1:1,250

The SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

This is a detailed planning map of the Heathrow Airport area in London. The map shows various buildings, roads, and a proposed development site highlighted in pink. The map includes labels for 'Flight Catering Centre', 'Warehouse', 'Depot', 'Heathrow Airport - London', 'Stanwell Road', 'Great South-West Road', 'St Mary's Church', and 'Bedfont Green'. A large purple circle is drawn over the central part of the map, and a pink rectangle highlights a specific area near the depot and warehouse.

Report Qualifications

1. This report (the "Report") has been prepared by CBRE Limited ("CBRE") exclusively for CBRE Global Investors on behalf of Canada Life European Real Estate Limited (the "Client") in accordance with the terms of engagement entered into between CBRE and the client dated 02 November 2017 ("the Instruction"). The Report is confidential and must not be disclosed to any person other than the Client without CBRE's prior written consent. CBRE has provided this report on the understanding that it will only be seen and used by the Client and no other person is entitled to rely upon it, unless CBRE has expressly agreed in writing. Where CBRE has expressly agreed that a person other than the Client can rely upon the report then CBRE shall have no greater liability to any party relying on this report than it would have had if such party had been named as a joint client under the Instruction.
2. CBRE's maximum aggregate liability to all parties, howsoever arising under, in connection with or pursuant to the Report, and whether in contract, tort, negligence or otherwise shall not exceed £1M.
3. CBRE shall not be liable for any indirect, special or consequential loss or damage howsoever caused, whether in contract, tort, negligence or otherwise, arising from or in connection with this Report. Nothing in this Report shall exclude liability which cannot be excluded by law.
4. This report was prepared for the sole use of the named Client, as defined above, and shall not be relied upon or transferred to any other party without the express written authorisation of CBRE. The report may contain material subject to copyright or obtained subject to license; unauthorised copying of this report will be in breach of copyright/license.
5. It is noted that flood risk is driven by natural processes and methods used to assess risk are based on estimates of flood likelihood and consequences. The findings and opinions provided in this report are given in good faith and are subject to the limitations imposed by employing site assessment methods and techniques, appropriate to the time of investigation and within the limitations and constraints defined within this document. The findings and opinions are relevant to the dates when the assessment was undertaken, but should not necessarily be relied upon to represent conditions at a substantially later date.
6. The findings and opinions conveyed, via this report, are based on information obtained from a variety of sources as detailed in this report. The information reviewed should not be considered as exhaustive and has been accepted in good faith as providing true and representative data pertaining to the site conditions. Therefore, CBRE cannot and does not guarantee the authenticity or reliability of the third-party information it has relied upon. CBRE reserve the right to alter the conclusions and recommendations presented in this report in the light of further information that may become available.
7. Where opinions expressed in this report are based on current available guidelines and legislation, no liability can be accepted by CBRE for the effects of any future changes to such guidelines and legislation. In the event that legislation changes it may be necessary for CBRE to update/modify this report in line with new guidance.
8. Where no/limited site inspections are undertaken (for example due to limited site access) CBRE cannot comment on the potential for environmental concerns associated with the current use or structure including the presence of Asbestos and Invasive Species. It should also be noted that any risks identified in this report are perceived risks

based on the information reviewed; actual risks can only be assessed following a physical investigation of the site.

9. We have not undertaken a specific Asbestos survey of the site and do not give advice on asbestos related matters, but we have included recommendations within the text of this report with regard to the need for specialist inspections and testing as appropriate.
10. At the time of our inspection, the site was in use and for reasons of safety we were unable to raise the drainage access covers. We have not therefore undertaken any inspection of the below ground drainage services and cannot comment on the condition thereof.
11. The limitations of liability of CBRE for the contents of this report have been agreed with the Client, as set out in the terms and conditions of instruction.
