## APPENDICES

APPENDIX A Existing and Proposed Site Layout

APPENDIX B TfL Bus Spider Map – South Ruislip

APPENDIX C PTAL Output – Base Year

APPENDIX D TIM Plan Outputs

APPENDIX E Swept Path Analysis – 16.5 Metre Articulated Vehicle

APPENDIX F TRICS Output – Non-food Retail

APPENDIX G TRICS Output – Retail / Food Superstore

# 1. Introduction

## 1.1 Overview

1.1.1 This Transport Statement (TS) has been prepared by mode transport planning (mode) on behalf of Lidl Great Britain to support a planning application at the Lidl Supermarket in South Ruislip. The site is located within the London Borough of Hillingdon (LBH), who also operate as the local highway authority.

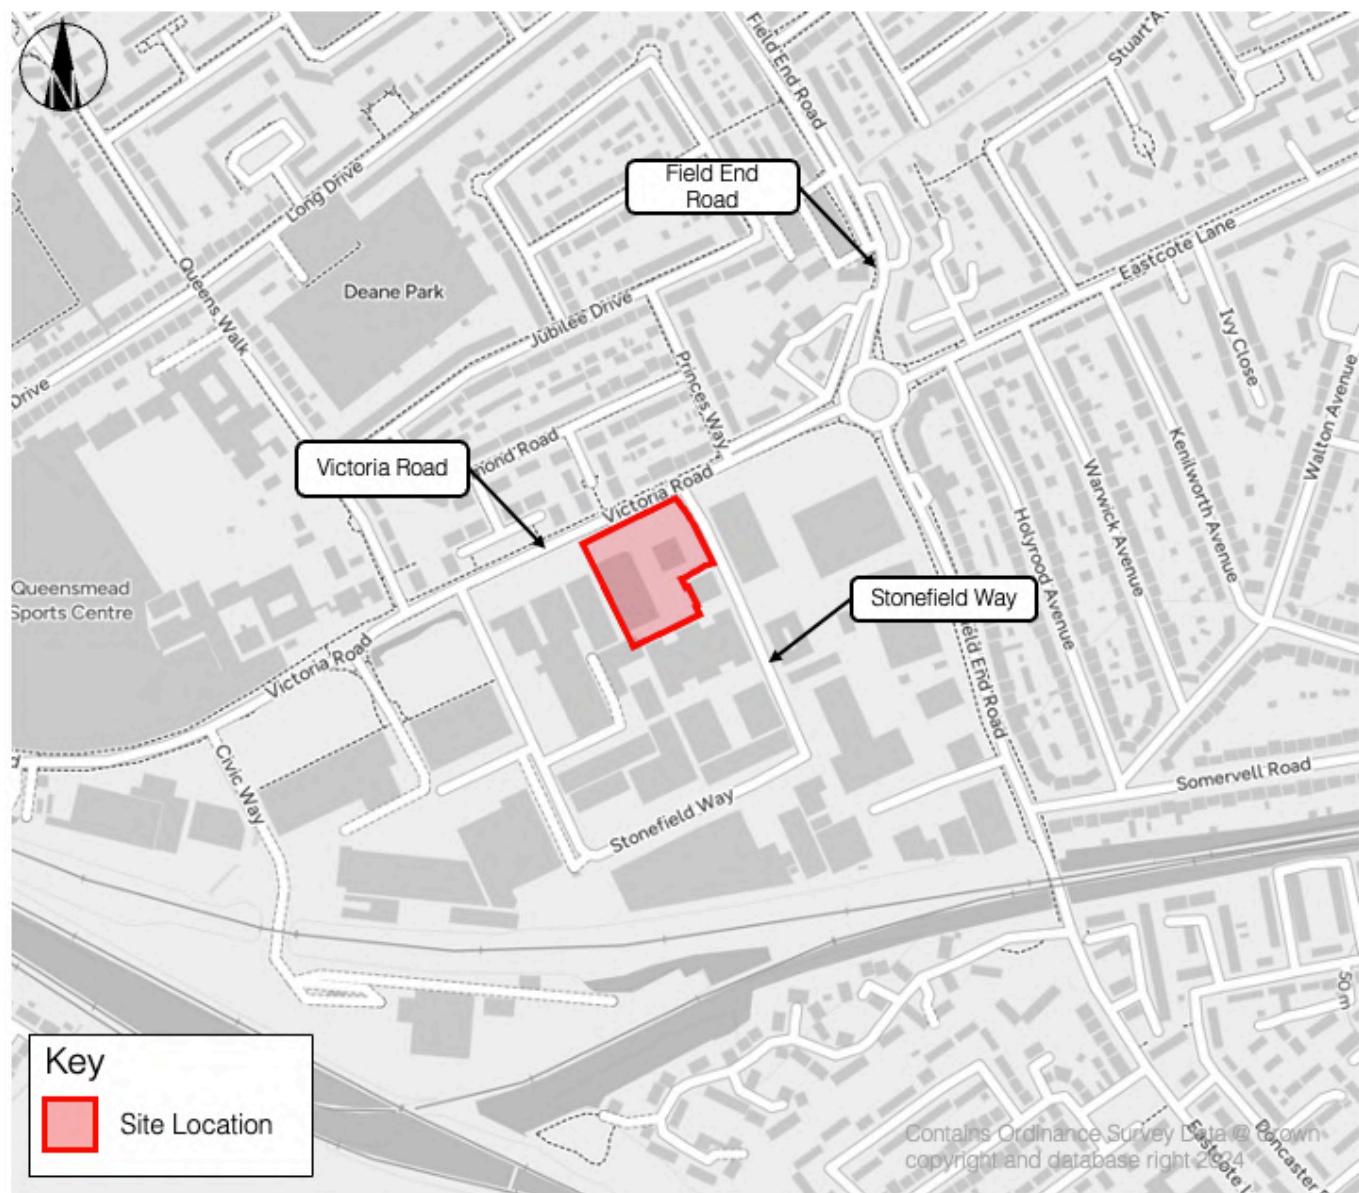

1.1.2 The development proposals comprise the demolition of the existing Benson for Beds unit at the site, an extension of the existing car park serving the store, and a new Deposit Return Scheme (DRS) lobby at the site totalling a Gross External Area (GEA) of 2,636m<sup>2</sup>. The car park will increase from 123 spaces to 136, representing an increase of 13 spaces. The spaces will be split as follows:

- 100 standard parking bays.
- 13 Blue Badge Holder spaces.
- 7 Brown Badge Holder spaces (Spaces for residents over 65).
- 12 Parent & Child spaces.
- 4 Active Electric Vehicle charging bays.

1.1.3 The site currently benefits from two vehicular access points, one on Victoria Road and a second on Stonefield Way. Stonefield Way operates two-way between Victoria Road and the Lidl access junction, at which point it converts to a one-way southbound operation, looping through the industrial estate to form another junction onto Victoria Road to the west.

1.1.4 A plan demonstrating the location of the site is provided on [Figure 1.1](#), with the proposed layout of the site provided in [Appendix A](#).

Figure 1.1 Site Location Plan

## 1.2 Planning History

Planning Ref: 5039/APP/2015/4395

1.2.1 An initial planning application was submitted in October 2017 for the construction of a supermarket with a non-retail food unit at the site. The scheme was permitted with 123 car parking spaces including 13 for Blue Badge Holders and 7 Brown Badge Holder spaces.

Planning Ref: 5039/APP/2020/1339

1.2.2 More recently, an application was submitted by Lidl and approved in August 2020 for the demolition of the Benson for Beds unit at the site and the extension of the existing car park by 23 spaces increasing the total parking capacity to 146 spaces.

1.2.3 However, this permission has now lapsed, and it is the intention to submit a new planning application at the site. The new application seeks the demolition of the Benson for Beds unit to extend the existing car park by 13 spaces, increasing the total parking capacity to 136 spaces. This represents a decrease of 10 spaces to the previous consent at the site. It is important to note that the floor area, access and servicing arrangements of the Lidl store is to remain unchanged as part of the proposals.

## 1.3 Structure of the Report

1.3.1 The remainder of this TS is structured as follows:

- **Chapter 2** – Policy and Guidance.
  - Identifies the applicable National, Regional and Local transport related policies and how the development proposals are in accordance with these.
- **Chapter 3** – Existing Situation.
  - Describes existing details of the site and its location in relation to local facilities and amenities, including sustainable transport infrastructure for pedestrians, cyclists and public transport users. This section also details the local highway network and the most recently available Personal Injury Collision (PIC) data.
- **Chapter 4** – Development Proposals.
  - Describes the development proposals including access arrangements, car and cycle parking provision and servicing arrangements.
- **Chapter 5** – Trip Generation.
  - Assesses the net trip generation associated with the development proposals using the TRICS database.
- **Chapter 6** – Sustainable Transport Improvements.
  - Details improvements to sustainable travel modes, such as walking and cycling, proposed as part of the development proposals. This also notes improvements to the car park operation arising from the development proposals.
- **Chapter 7** – Summary and Conclusions.
  - Sets out the summary and conclusions of the report.

## 2. Planning Policy Context

### 2.1 Overview

2.1.1 This section of the report details the transport aspects of adopted National and Local policies relevant to the development proposals that have informed the preparation of this TS.

### 2.2 National Policy

#### National Planning Policy Framework (NPPF)

2.2.1 The National Planning Policy Framework (NPPF, December 2023) sets out the Government's planning policies for England and how these are expected to be applied. The NPPF presumes in favour of sustainable development and is a material consideration in planning decisions.

2.2.2 Local planning authorities should approach decisions on proposed developments in a positive and creative way, using the full range of planning tools available including brownfield registers and work proactively with applicants to secure development that will improve the economic, social and environmental conditions of the area. Decision-makers at every level should seek to approve applications for sustainable development where possible.

2.2.3 Central to the NPPF is a "presumption in favour of sustainable development" (paragraph 11), which for decision-taking means that:

- *"approving development proposals that accord with an up-to-date development plan without delay; or;*
- *where there are no relevant development plan policies, or the policies which are most important for determining the application are out-of-date, granting permission, unless:*
- *the application of policies in this Framework that protect areas or assets of particular importance provides a clear reason for refusing the development proposed; or*
- *any adverse impacts of doing so would significantly and demonstrably outweigh the benefits, when assessed against the policies in this Framework taken as a whole."*

2.2.4 The NPPF states within Paragraph 114 that *"In assessing sites that may be allocated for development in plans, or specific applications for development, it should be ensured that:*

- *appropriate opportunities to promote sustainable transport modes can be – or have been – taken up, given the type of development and its location;*
- *safe and suitable access to the site can be achieved for all users;*
- *the design of streets, parking areas, other transport elements and the content of associated standards reflects current national guidance, including the National Design Guide and the National Model Design Code; and*

- *any significant impacts from the development on the transport network (in terms of capacity and congestion), or on highway safety, can be cost effectively mitigated to an acceptable degree."*

2.2.5 As such, Paragraph 115 states that "*Development should only be prevented or refused on highways grounds if there would be an unacceptable impact on highway safety, or the residual cumulative impacts on the road network would be severe.*"

### National Planning Policy Guidance (NPPG)

2.2.6 The NPPG is a web-based source which supports the NPPF with further information for planners, developers, and the public on measures to support planning applications. The guidance aims to facilitate the development of a robust evidence base that will enable an assessment of the transport impacts of both existing and proposed development.

2.2.7 The NPPG states that both Transport Assessments and Travel Plans can positively contribute to:

- *Encouraging sustainable travel;*
- *Lessening traffic generation and its detrimental impacts;*
- *Reducing carbon emissions and climate impacts.*
- *Creating accessible, connected, inclusive communities.*
- *Improving health outcomes and quality of life.*
- *Improve road safety.*
- *Reducing the need for new development to increase existing road capacity or provide new roads.*

## 2.3 Regional Policy

### The London Plan (2021)

2.3.1 The London Plan sets out a strategic framework for how London will develop over the next 20-25 years. All London Borough local planning authorities' development plans are required to be in 'general conformity' with the London Plan. This is to ensure an integrated London planning system which is joined up and is reflective of the overall strategy for how London can develop sustainably.

2.3.2 Chapter 10 of the London Plan relates to Transport, and outlines key policies which aim to help developments be more sustainable in the present and going forward, with the most relevant being:

### Policy T1: Strategic approach to transport

- *"All development should make the most effective use of land, reflecting its connectivity and accessibility by existing and future public transport, walking and cycling routes, and ensure that any impacts on London's transport networks and supporting infrastructure are mitigated."*

### Policy T3: Transport capacity, connectivity and safeguarding

- “Development Plans should develop effective transport policies and projects to support the sustainable development of London and the Wider South East as well as to support better national and international public transport connections.”

### Policy T4: Assessing and mitigating transport impacts

- “Development Plans and development proposals should reflect and be integrated with current and planned transport access, capacity and connectivity.

When required in accordance with national or local guidance, transport assessments/statements should be submitted with development proposals to ensure that impacts on the capacity of the transport network (including impacts on pedestrians and the cycle network), at the local, network-wide and strategic level, are fully assessed. Transport assessments should focus on embedding the Healthy Streets Approach within, and in the vicinity of, new development.”

### Policy T5: Cycling

- “Development Plans and development proposals should help remove barriers to cycling and create a healthy environment in which people choose to cycle.”

### Policy T6: Car Parking

- “Where sites are redeveloped, parking provision should reflect the current approach and not be re-provided at previous levels where this exceeds the standards set out in this policy. Some flexibility may be applied where retail sites are redeveloped outside of town centres in areas which are not well served by public transport, particularly in outer London.”

## 2.4 Local Policy

2.4.1 Local policy within LBH is contained within the Local Plan, comprising Part 1 – Strategic Policies (adopted in 2013) and Part 2 – Development Management Policies and Site Allocations and Designations (adopted in January 2020).

2.4.2 The Local Plan Part 1 sets out the strategic aims for the borough alongside policies for the period up to 2026. Policy T1 relates to accessible local destinations, stating that all development should encourage access by sustainable modes and include good walking and cycling provision.

2.4.3 Local Plan Part 2 provides more detailed planning policies for the borough, in addition to allocating sites for development.

2.4.4 Policy DMT1 relates to managing transport impacts and states:

- “Development proposals will be required to meet the transport needs of the development and assess its transport impacts in a sustainable manner. In order for developments to be acceptable they are required to:

- *Be accessible by public transport, walking and cycling either from the catchment area that it is likely to draw its employees, customers or visitors from and/or the services and facilities necessary to support the development;*
- *Maximise safe, convenient and inclusive accessibility to, and from within developments for pedestrians, cyclists and public transport users; ...*
- *Adequately address delivery, servicing and drop-off requirements; and*
- *Have no significant adverse transport or associated air quality and noise impacts on the local and wider environment, particularly on the strategic road network".*

2.4.5 Policy DMT1 continues to state that major developments should be accompanied by a Transport Assessment (TA) and Travel Plan, or Transport Statement where the thresholds for a TA are not met.

2.4.6 Policy DMT5 relates to pedestrians and cyclists and states that development proposals should provide safe, direct and inclusive access. This also states that cycle parking should be provided in accordance with the cycle parking standards at Appendix C of the document.

2.4.7 Vehicle parking is covered within Policy DMT6, stating the parking standards within Appendix C of the document should be applied to developments. This states that all car parks will be required to include conveniently located spaces for wheelchair users and those with restrictive mobility in line with the Accessible Hillingdon SPD.

2.4.8 The Accessible Hillingdon SPD requires 5% of parking provision to be made available for Brown Badge Holders and 10% for Blue Badge Holders.

2.4.9 The accompanying text to Policy DMT6 acknowledges the Mayor's Transport Strategy (MTS), stating that *"in outer London, proposals need to acknowledge the role of the car, especially low emission cars."*

2.4.10 In addition, the accompanying text identifies that parking standards should not disadvantage outer London in competition with the wider South East. This continues to state that:

- *"Hillingdon's parking standards are based on those contained in the London Plan with some variance to address local circumstances in terms of employment sites and residential uses. The standards contained within Appendix 1 Table C [sic: parking standards are contained within Appendix C Table 1] are expressed as maximum levels and do not imply any minimum level".*

2.4.11 The parking standards in Appendix C require vehicular parking standards, requiring food retail stores with a gross floorspace over 2,500 square metres and located in PTAL 4 – 2 locations to provide one vehicle space per 25 – 18 square metres.

2.4.12 For cycle parking, Appendix C indicates that a maximum of one space per 350 square metres should be provided at A1 shops in out of centre locations. It is considered that this provision is below the levels set out within the London Plan. It is therefore considered more appropriate to refer to the London Plan when assessing cycle parking provision to encourage sustainable travel to and from the site.

## 2.5 Summary

- 2.5.1 National, Regional and Local development policy clearly encourages new development to be located in areas that are readily accessible on foot, cycle and by public transport, making use of available sites within built up locations.
- 2.5.2 This TS provides an assessment of the development proposals. Existing sustainable transport connections in the locality and how the proposed development links to them is detailed along with a detailed assessment of the traffic impact of the development proposal on the local highway network. The assessment will show the proposed development accords with the sustainable transport objectives of national, regional and local policy as detailed above.

## 3. Existing Conditions

### 3.1 Overview

3.1.1 This chapter provides an overview of the surrounding context in which the site is located, including a review of the sustainable transport accessibility at the site, PIC data, a review of Public Transport Accessibility Level (PTAL) and Travel Time Mapping (TIM) metrics as well as a description of the local road network.

### 3.2 Site Location

3.2.1 The site is located within South Ruislip, which is located southwest of Harrow and north of Hayes within the LBH authority area. The site fronts onto Victoria Road and Stonefield Way, with the site occupying the corner plot between these two roads.

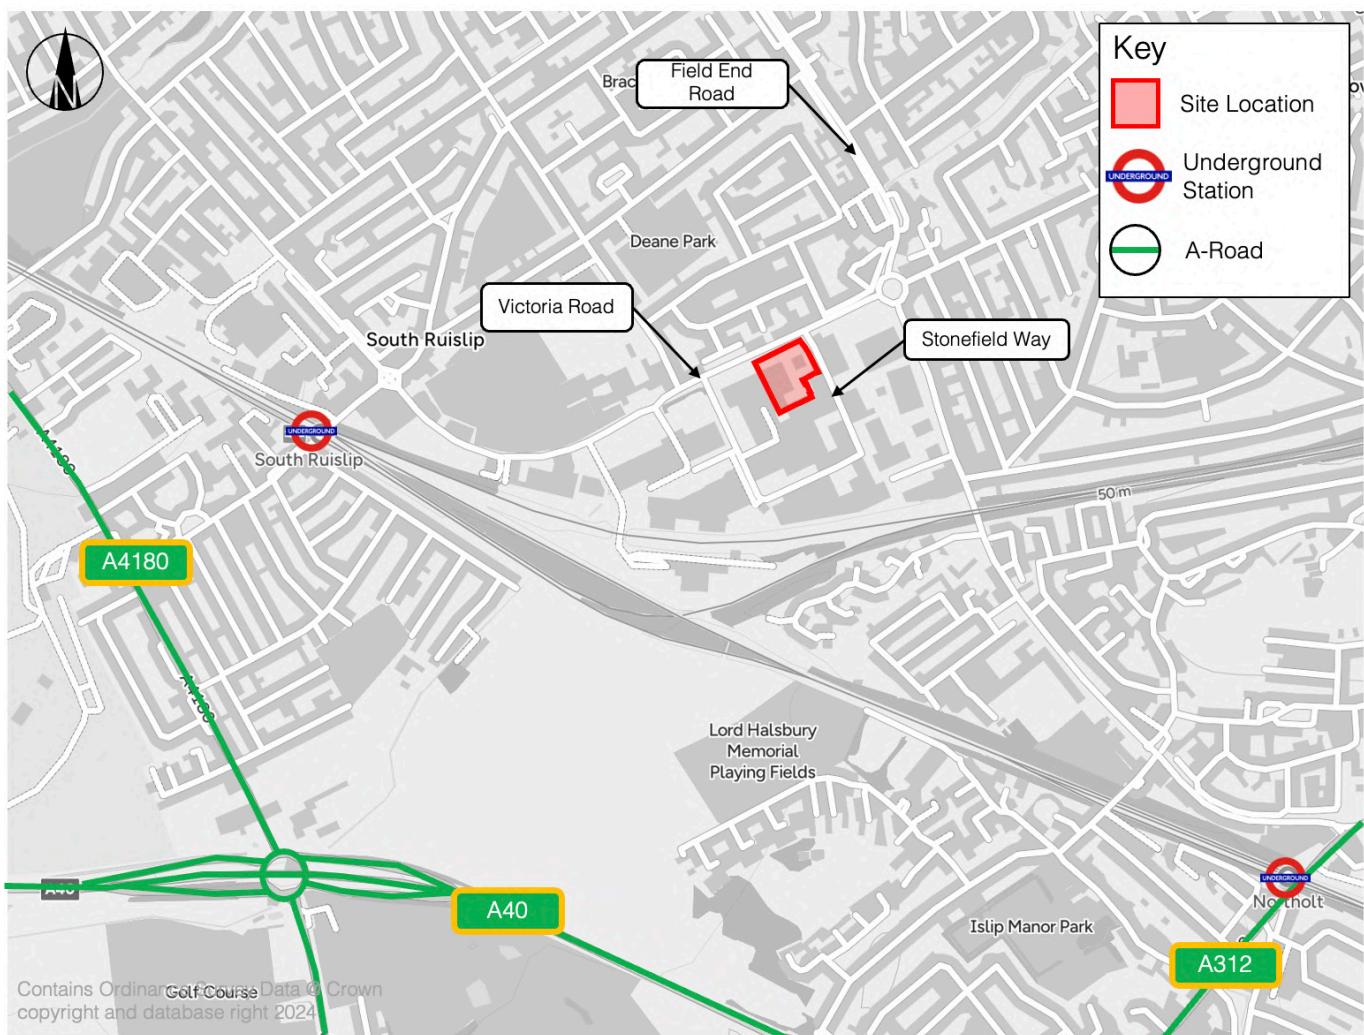

3.2.2 The site currently comprises a Lidl supermarket and a unit currently operated by Benson for Beds, which is served by 123 spaces. Access to the site is via Victoria Road and Stonefield Way.

3.2.3 Victoria Road is a single-carriageway local distributor road subject to a 30mph speed limit and routes west towards South Ruislip centre, before continuing northwards towards Ruislip, and northeast towards South Harrow, becoming Eastcote Lane. Victoria Road provides access to residential areas of South Ruislip, Northolt and Eastcote from the Victoria Road/Field End Road roundabout junction to the northeast of the site.

3.2.4 Stonefield Way is also subject to a 30mph speed limit and provides a circular route to access several industrial uses, egressing onto Victoria Road to the west of the site. Between the site access and Victoria Road, Stonefield Way is open to two-way traffic, though is restricted to one-way southbound movements to the south of the site access junction.

3.2.5 The site is also within close proximity to the A40, with the nearest exit located southwest of the site, via the A4180 West End Road. The A40 provides links towards Central London eastbound and Uxbridge and the M25 westbound. The local highway network is demonstrated on [Figure 3.1](#).

Figure 3.1 Local Highway Network Plan

### 3.3 Pedestrian Accessibility

3.3.1 The site benefits from pedestrian access onto Victoria Road and Stonefield Way, linking into the surrounding footway network. Victoria Road benefits from footways along both sides of the carriageway with a zebra crossing complete with central refuge island provided along the site frontage. To the west of the site, a pedestrian refuge island crossing is provided across Victoria Road.

3.3.2 A pedestrian refuge island is also present across Stonefield Way, for pedestrians crossing at the Victoria Road junction.

### 3.4 Cycle Accessibility

3.4.1 The site is well located with regard to cycling with a cycle lane located on Eastcote Lane to the east of the site. This provides links to other cycleways, that provide links towards Rayners Lane and Northolt Park either going north or south of Alexandra Avenue / Eastcote Lane Junction respectively.

## 3.5 Public Transport Accessibility

### Bus Accessibility

- 3.5.1 The closest bus stops to the site are located along the site frontage along Victoria Road. Bus stop 'N' provides access to westbound services and is located approximately 10m from the site's pedestrian access onto Victoria Road. Bus stop 'K' provides access to eastbound services and is located approximately 100m walk from the Victoria Road pedestrian entrance, via the zebra crossing facility on Victoria Road. These bus stops are served by the 114 bus service routing between Ruislip station and Mill Hill Broadway station every 8-10 minutes in each direction during daytime periods.
- 3.5.2 Additional bus services are located on Field End Road to the east of the site, with bus stops 'T' and 'X' located approximately 350m walk from the Victoria Road pedestrian access. These bus stops provide access to the 282 service routing between Ealing Hospital and Mount Vernon Hospital with five buses per hour in each direction during daytime periods.
- 3.5.3 For reference, the relevant TfL bus spider map is provided in [Appendix B](#).

### Tube / Rail Accessibility

- 3.5.4 South Ruislip station is located approximately 1.2km to the west of the site and is served by the TfL Central Line and Chiltern Railways.
- 3.5.5 Central Line services operate between West Ruislip to Epping. The frequency of service depends on the time of day, day of the week and direction of travel, though South Ruislip is typically served by frequent services in each direction.
- 3.5.6 The Chiltern Railways currently operate services between London Marylebone and Aylesbury with an hourly service toward either destination.

## 3.6 Transport Connectivity

- 3.6.1 TfL assesses the connectivity of an area based on the WebCAT Toolkit, which includes an assessment of Public Transport Accessibility Level (PTAL), travel time mapping (TIM) and catchment analysis to provide an overview of the transport network for a given location.

### Public Transport Accessibility Level

- 3.6.2 PTAL is a theoretical measure of the accessibility of a given point to the public transport network, taking into account walk time and service availability. This method is a way of measuring the density of the public transport network at a particular point.

3.6.3 Walk times are calculated from the specified point of interest to all public transport access points, including bus stops and stations within pre-defined catchments. The PTAL incorporates a measure of service frequency at each public transport access point. A reliability factor is added and the total access time is calculated. The Equivalent Doorstep Frequency (EDF) is then derived for each point. These are summed for all modes within the catchment and the PTALs for the different modes are added together to provide a single value. The PTAL is categorised into nine levels, 1a to 6b where 6b represents a high level of accessibility and 1a a low level of accessibility.

3.6.4 The PTAL rating at the two site access junctions is 2, with the remainder of the site located within a PTAL 1b location. The PTAL output is provided in [Appendix C](#).

### Travel Time Mapping

3.6.5 Travel time mapping offers an opportunity to review the connectivity of a site by specific travel modes or across all public transport modes and is available via the WebCAT TIM online calculator.

3.6.6 TIM plans have been prepared for average travel between peak periods and in the weekday evening peak period for all public transport modes, with the outputs provided in [Appendix D](#).

3.6.7 The TIM plans indicate that South Ruislip, Northolt, South Harrow and Eastcote are all accessible within a 30-minute public transport travel time. Harrow, Wembley and Southall are all accessible within a 45-minute public transport travel time.

## 3.7 Personal Injury Collision

3.7.1 Personal injury collision (PIC) data has been obtained from Crashmap Pro for the most recently available five-year period of 2018 to 2023.

3.7.2 Following a review of the data, there were only four slight collisions identified within the area:

- [2018010132564](#): This collision involved a pedestrian and a car and occurred in the vicinity of the London Stone and Tiles Ltd store to the east of the site.
- [2018010146912](#): This collision involved a pedestrian and a goods vehicle on the Victoria Road / Stonefield Way junction during a wet weather conditions in the evening.
- [2021010318480](#): This collision involved a pedestrian and a car and occurred in the vicinity of the site during the afternoon on a dry road surface.
- [2022010372398](#): This collision involved a motorcycle and car and occurred on Victoria Road during early morning.

3.7.3 One serious collision was also identified within the area:

- [2020010266368](#): This collision involved a motorcycle and car on Victoria Road, which resulted in the casualty of the motorcycle user during the evening on dry road conditions.

3.7.4 From the collision within the time period suggests that there is no pattern of consistent road collisions happening and that all of these collisions are a product of driver error. On this evidence, it is concluded that there are no underlying highway safety issues in the area and the proposals will not exacerbate collision rates.

3.7.5 Furthermore, the development proposals will include additional pedestrian crossing facilities within the car park as well as an improved layout of the car park, creating a better environment for highway safety. Further detail on the proposals is provided later in this report.

### 3.8 Summary

3.8.1 In summary, this section has demonstrated that the site currently benefits from a range of travel modes to access the site, including buses towards Harrow and Greenford and underground / train provision at South Ruislip station. The supermarket is located close to a number of residential areas such as South Harrow and Eastcote.

3.8.2 In addition, following a review of PIC data through Crashmap Pro, it is noted that there are no recurring collisions and therefore, there are no highway safety concerns that the development proposals will exacerbate on the surrounding highway network.

## 4. Development Proposals

### 4.1 Overview

- 4.1.1 The site is currently occupied by a Lidl supermarket, with a 2,636sqm GEA which includes for a new DRS lobby, and a 702sqm GIA non-food retail unit, currently occupied by Bensons for Beds.
- 4.1.2 The proposed development seeks to demolish the non-food retail unit at the site, with a new DRS lobby proposed within the warehouse area of the existing Lidl supermarket. The sales floor area of the Lidl supermarket remains unchanged.
- 4.1.3 In place of the demolished non-food retail unit, additional car parking will be provided alongside improved pedestrian facilities in the form of crossings within the site. The existing and proposed site layout plans are provided in [Appendix A](#).
- 4.1.4 It is noted that the majority of the site layout is unchanged as a result of the development proposals, with the proposals affecting the area of parking immediately east of the Victoria Road junction and the area immediately surrounding the Bensons unit. The layout generally aligns with that approved as part of application 5039/APP/2020/1339 and is therefore considered to be acceptable. The main change is the level of car parking being provided, which is further detailed below.

### 4.2 Access Arrangements

- 4.2.1 The site is accessed from Victoria Road, by means of a simple priority junction. A second vehicular access is provided onto Stonefield Way, which provides two-way traffic between the Lidl access and Victoria Road. These access improvements were completed as part of the S278 works associated with the planning permission, with the store operating via the Stonefield Way one-way system prior to these works being completed. No changes are proposed to the site vehicular accesses.
- 4.2.2 Pedestrian access into the site is provided from Victoria Road, with a separate pedestrian access provided to the east of the vehicular access.
- 4.2.3 A key benefit of the revised car parking layout is to provide improved pedestrian links within the site. This is in the form of pedestrian footways off the car park carriageway, thereby minimising conflict between cars and pedestrians. This is considered an improvement on the existing situation and minimises risk moving forward.

### 4.3 Car Parking

- 4.3.1 As set out earlier in this TS, it is the intention to revise the proposals to provide a reduced level of parking to that previously agreed as part of the 2020 approved application (Ref: 5039/APP/2020/1339).

4.3.2 The site currently benefits from 123 car parking spaces, of which 13 are designated as Blue Badge Holder spaces and 7 as Brown Badge Holder spaces. In addition, 4 spaces are designated as Parent & Child spaces, with electric vehicle charging provided in the form of a rapid charging unit serving 2 spaces.

4.3.3 Parking standards within the LBH are contained within the Local Plan Part 2 (2020) Appendix C. Food retail units with a gross floor area of greater than 2,500 square metres within a PTAL 4 – 2 location should provide one parking space per 25 – 18 square metres. Based on the 2,636sqm GEA area of the existing Lidl supermarket, the maximum parking provision for the site would be 105 – 146 spaces.

4.3.4 The development proposals include for increasing parking by 13 spaces to 136 spaces to improve the operation and functionality of the car park. It is also noted that the proposed increase in parking is in line with the maximum parking in accordance with policy at the site and is therefore considered to be acceptable.

4.3.5 It should also be noted that there has been a relocation of the Parent & Child spaces to be closer to the respective site accesses, whilst maintaining a convenient pedestrian link to supermarket access through the use pedestrian crossing facilities.

4.3.6 In accordance with the Accessible Hillingdon SPD, the car park includes 13 Blue Badge Holder spaces and 7 Brown Badge Holder spaces, which equates to 10% Blue Badge Holder provision and 5% Brown Badge Holder provision.

4.3.7 Electric vehicle charging is to remain on the site, with 2 extra spaces proposed from the existing layout bringing the total number of spaces to 4. The provision of a rapid charging unit is considered to provide greater benefit than an increased number of slower chargers.

4.3.8 As a rapid charger can charge a vehicle to 80% in less than 30 minutes, this is considered to provide a usable alternative whilst shopping in the store. As such, no changes are proposed to the electric vehicle parking provision at the site.

4.3.9 Based on the previously approved application, the additional parking provision proposed is deemed acceptable based on the standards LBH has set within their relevant documents for this development. In addition, given a greater level of parking was approved under application 5039/APP/2020/1339, the reduced level of parking as part of this application is considered to be acceptable.

## 4.4 Cycle Parking

4.4.1 No changes are proposed to the cycle parking provision at the site, despite the overall quantum of development decreasing through the demolition of the non-food Bensons unit.

4.4.2 The proposals involve the relocation of the cycle parking at the site, from the current location adjacent to the Bensons unit to an area along the Victoria Road frontage within 15m of step-free walking distance of the store entrance. Some of the long-stay spaces for staff are to be relocated to the rear of the site, which will provide secure and covered cycle parking.

4.4.3 Cycle parking standards are provided within the London Plan, which requires long-stay and short-stay cycle parking to be provided at the site. **Table 4.1** has summarised the policy requirements and minimum cycle parking to be provided at the site based on the 2,636sqm GEA for food retail use.

**Table 4.1 Cycle Parking Standards**

Type	Minimum Parking Standard	Minimum Cycle Parking	Proposed Cycle Parking
Long-stay	One space per 175 sqm	15	18
Short-stay	First 750 sqm. One space per 40 sqm Thereafter: One space per 300 sqm	19+ 6	30

4.4.4 **Table 4.1** indicates that the development as built should provide 15 long-stay and 25 short-stay cycle parking spaces. The development proposals include for retaining 18 long-stay and 30 short-stay cycle parking spaces, thereby providing above the minimum levels required by policy.

## 4.5 Servicing Arrangements

4.5.1 No alterations are proposed to the Lidl supermarket servicing, which will remain undertaken via 16.5m articulated vehicles through the site car park to the dedicated servicing area. Swept path analysis of the 16.5m vehicle servicing within the updated car parking layout is provided in **Appendix E**.

4.5.2 Servicing for the supermarket is currently managed through a Servicing Management Plan at the site, which details that servicing vehicles will only access the site via the Stonefield Way Access. As no alterations are proposed to the servicing arrangements as a result of this application, this document has not been specifically updated for this planning application.

4.5.3 Another benefit of the scheme is to remove the additional servicing movements associated with the Bensons unit, which while infrequent, still provide a potential conflict with car park users, as the Benson's servicing area is opposite car parking spaces.

## 5. Net Impact of Development Proposals

### 5.1 Overview

5.1.1 This section assesses the net impact of the development proposals, accounting for the increase in parking spaces at the site alongside the decrease in trips associated with the loss of the non-food retail unit.

5.1.2 The previously approved TRICS assessment and methodology presented as part of planning application 5039/APP/2020/1339 has been adopted to inform this chapter, including the hours assessed, which includes the weekday morning peak hour (08:00 – 09:00), weekday evening peak hour (17:00 – 18:00) and Saturday peak hour (14:00 – 15:00).

5.1.3 It is important to note that while the development proposals include for a new DRS lobby, this will not generate new trips to the site as the trips will be comprised of customers already visiting the Lidl supermarket.

### 5.2 Existing Non-food Retail Unit Trips

5.2.1 In accordance with the methodology which accompanied the approved planning application (Ref: 5039/APP/2020/1339), the category '01 Retail – G: Other Individual Non-food Superstore' has been adopted for sites located within England, including Greater London.

5.2.2 **Table 5.1** has summarised the peak hour trip rates and trips, based on the existing 702sqm non-food retail unit. The TRICS outputs are provided in [Appendix F](#).

**Table 5.1 Existing Non-food Retail Unit Trip Rates (per 100 sqm) and Trips**

	Weekday AM Peak		Weekday PM Peak		Saturday Peak	
	Arr	Dep	Arr	Dep	Arr	Dep
Vehicular Trip Rates	0.191	0.109	1.390	1.527	3.746	3.626
Vehicular Trips	1	1	10	11	26	25

5.2.3 **Table 5.1** indicates that the non-food retail unit at the site could generate 2 two-way vehicular trips during the weekday morning peak hour and 21 two-way vehicular trips during the weekday evening peak hour. During the Saturday peak hour, the non-food retail unit could generate 51 two-way vehicular trips.

## 5.3 Proposed Car Parking Trips

5.3.1 To assess the potential impact of the increased car parking at the site, the TRICS database has been assessed using the category '01 Retail – A: Food Superstore' for sites located within England, including Greater London, with a retail floor area of up to 7,000sqm. Sites with petrol filling stations have also been excluded. The above criteria match those agreed by the granting of planning permission for the development.

5.3.2 Instead of assessing the site based on floor area, the assessment below utilises the number of parking spaces as the calculation factor, thereby allowing a calculation of the additional parking impact to be identified.

5.3.3 **Table 5.2** has summarised the peak hour trip rates and trips, based on the additional 13 car parking spaces at the site (over the existing provision), with the TRICS output included at **Appendix G**.

**Table 5.2 Proposed Car Parking Trip Rates (per Parking Space) and Trips**

	Weekday AM Peak		Weekday PM Peak		Saturday Peak	
	Arr	Dep	Arr	Dep	Arr	Dep
Vehicular Trip Rates	0.447	0.355	0.768	0.763	1.026	1.007
Vehicular Trips	6	5	10	10	13	13

5.3.4 **Table 5.2** indicates that the additional on-site car parking could generate 11 two-way vehicular trips in the weekday morning peak hour and 20 two-way vehicular trips during the weekday evening peak hour. During the Saturday peak hour, the additional parking could generate 26 two-way vehicular trips.

## 5.4 Net Impact of Development Proposals

5.4.1 **Table 5.3** has summarised the net impact of the proposals, subtracting the existing site non-food retail trips identified within **Table 5.1** from the potential increase in trips from the additional car parking spaces, identified within **Table 5.2**.

**Table 5.3 Net Impact of Development Proposals**

	Weekday AM Peak		Weekday PM Peak		Saturday Peak	
	Arr	Dep	Arr	Dep	Arr	Dep
Existing Non-Food Retail Unit	1	1	10	11	18	17
Proposed Car Parking	6	5	10	10	13	13

	Weekday AM Peak		Weekday PM Peak		Saturday Peak	
	Arr	Dep	Arr	Dep	Arr	Dep
Net Impact	+5	+4	0	-1	-5	-4

5.4.2 **Table 5.3** indicates that the development could lead to an increase of 9 two-way vehicular trips in the weekday morning peak hour and a decrease of 1 two-way vehicular trips in the weekday evening peak hour. During the Saturday peak hour, the development could result in a decrease of 9 two-way vehicular trips. On this basis, the development proposals will have a negligible impact on the surrounding highway network.

5.4.3 It is also important to note that the net increase is lower than what was previously approved and therefore considered acceptable from a highway impact perspective.

## 6. Sustainable Transport Improvements

### 6.1 Overview

6.1.1 Whilst the change in vehicular trips to the site is not anticipated to materially change as a result of the development proposals, a number of improvements to sustainable travel options and safety within the site are proposed.

### 6.2 Pedestrian Improvements

6.2.1 The site will benefit from improved pedestrian access onto Stonefield Way, which currently separates pedestrians onto the carriageway at the site access junction. From here, pedestrians are required to walk in the carriageway to the store entrance. The development proposes to convert this walking route into a dedicated footway providing greater protection to pedestrians within the car park.

### 6.3 Cycle Parking Improvements

6.3.1 Whilst the development proposals do not alter the cycle parking provision at the site, they do include for relocating the short-stay and some of the long-stay cycle parking to the Victoria Road frontage, between the pedestrian and vehicular access points. This ensures the cycle parking is optimally placed opposite the store entrance to encourage its use.

6.3.2 In addition, this cycle parking provision is provided above policy standards ensuring sufficient provision is provided on site to accommodate the demand, which is monitored as part of the Travel Plan at the site.

### 6.4 Car Park Operation Improvements

6.4.1 In addition to the above, a number of improvements to the car park operation are noted. The reduction in servicing movements associated with the Bensons unit provides a benefit to the car park operation. This reduces potential conflicts within the car park by reducing the presence of HGVs manoeuvring adjacent to car parking areas.

6.4.2 Another benefit arising from the removal of the non-food retail unit is improved visibility throughout the car park, as the building will be removed. This ensures that vehicles and pedestrians are able to see others and allows for improved identification of available parking spaces on-site by drivers.

## 7. Summary and Conclusion

### 7.1 Summary

7.1.1 This TS has been prepared by mode transport planning to accompany a planning application at the Lidl supermarket, Victoria Road, South Ruislip.

7.1.2 The development proposals seek to demolish the existing non-food retail unit at the site, currently occupied by Bensons for Beds, and replace it with additional car parking and improved pedestrian links. The development proposals also include for a new DRS lobby within the warehouse area of the existing Lidl supermarket building. It is important to note that the floor area of the Lidl supermarket building will remain unchanged and the new DRS lobby will not generate new trips to the site as the trips will be comprised of customers already visiting the Lidl supermarket.

7.1.3 When considering the proposals at the site, it is noted that the most recent application (planning ref: 5039/APP/2020/1339) submitted by Lidl was approved in August 2020 for the demolition of the Benson for Beds unit at the site and the extension of the existing car park by 23 spaces increasing the total parking capacity to 146 spaces. This is important in the context of the revised proposals, which seek to increase parking at the site by 13 spaces to 136.

7.1.4 In summary, this TS has identified the following:

- The site is located in close proximity to bus stops along Victoria Road, with additional bus stops located along Field End Road. Victoria Road provides walking and cycling links to surrounding residential areas and to South Ruislip station to the west of the site.
- The development proposals include for increasing car parking by 13 spaces to 136 spaces at the site in accordance with LBH's parking standards. In line with the Accessible Hillingdon SPD, 13 spaces (10%) are dedicated for Blue Badge Holders and 7 spaces (5%) for Brown Badge Holders.
- The development proposals retain the 2 accesses on Victoria Road and Stonefield Way and the dedicated servicing area next to the Lidl supermarket. The site will also benefit from the reduced service movements from the removal of Benson for Beds from the site.
- The development proposals include for improving the existing walking and cycling links within the site, providing a dedicated route between the store entrance and Stonefield Way and relocating cycle parking opposite the store entrance along the Victoria Road frontage. Additional improvements within the site include reductions in the number of servicing trips by removing the non-food retail unit and improved visibility within the car park.
- The development proposals are likely to result in an increase of 9 two-way vehicular trips in the weekday morning peak hour and a decrease of 1 two-way vehicular trips in the weekday evening peak hour. During the Saturday peak, the development proposals could result in a reduction of 9 two-way vehicular trips to the site. This level of increase in the morning peak is considered to be immaterial. When considering the impact of the proposals, it is also important to note that the impacts are lower than that approved of application 5039/APP/2020/1339 and is therefore considered to be acceptable.

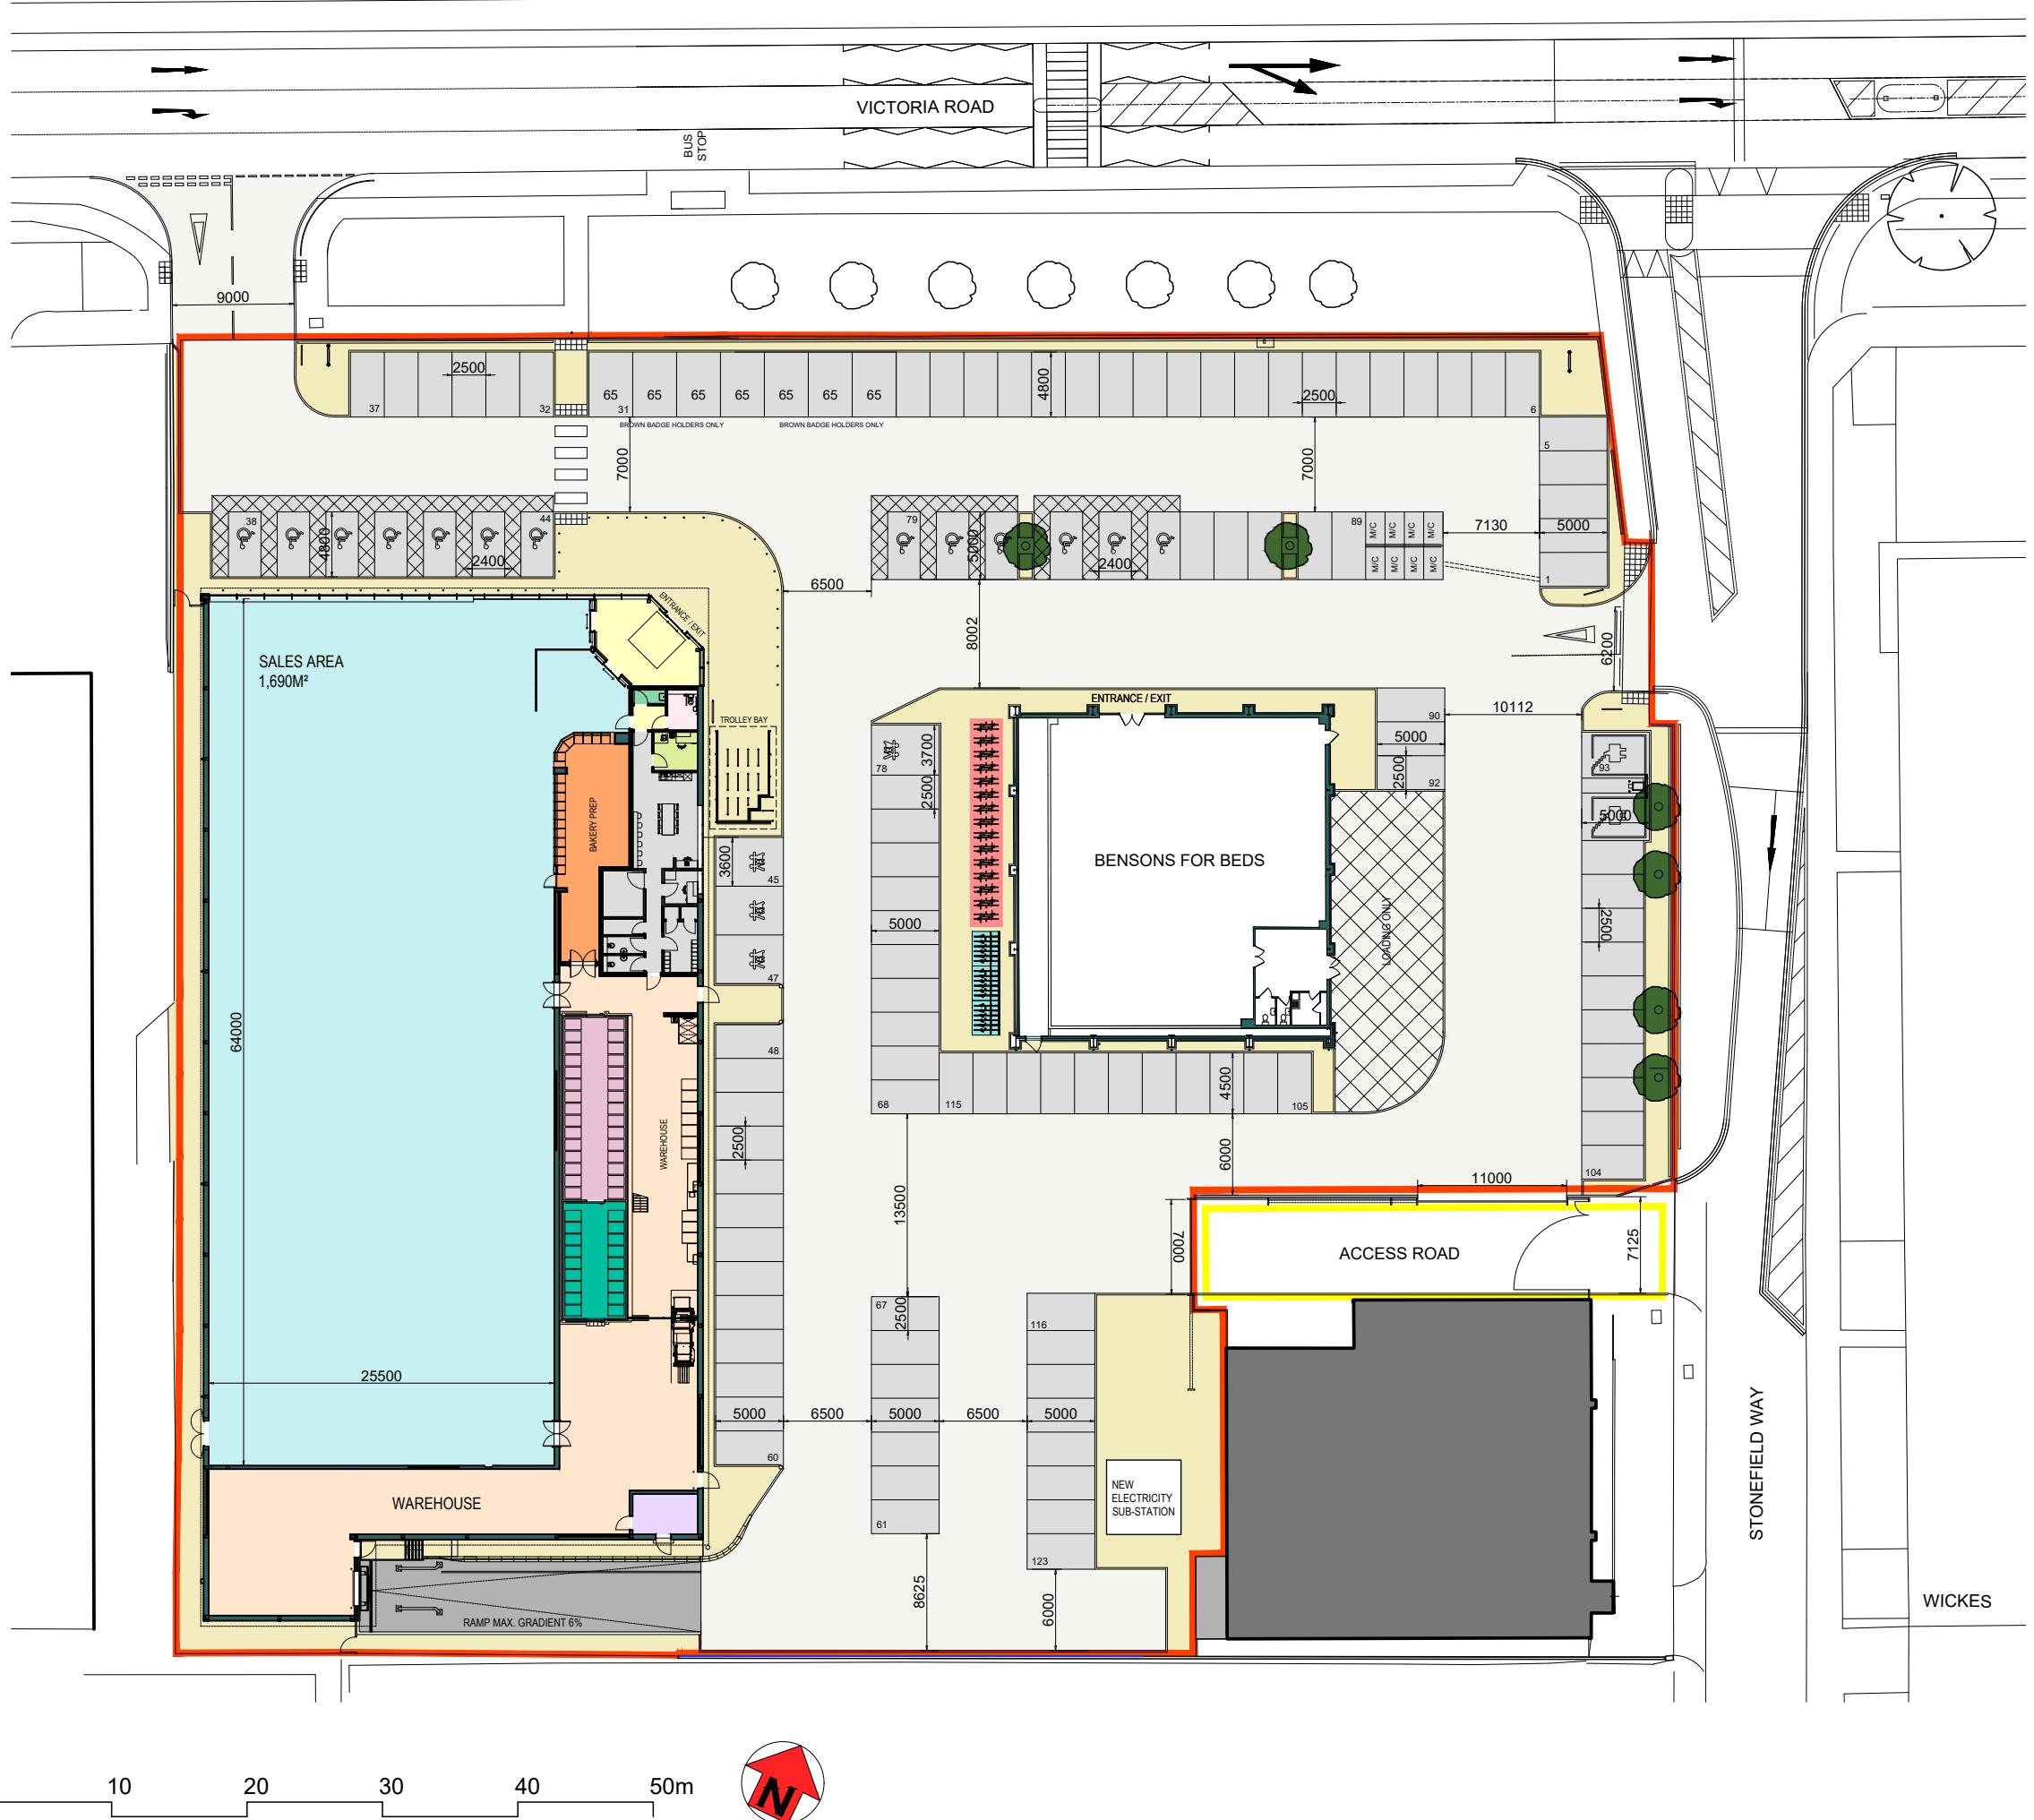

## 7.2 Conclusion

- 7.2.1 In view of the above, the development proposal is considered to be acceptable in transport terms and meets with Local, Regional and National policy objectives. The work undertaken has shown that the development would result in a negligible change in vehicle movements at the site and therefore the proposals will not have a severe impact on the local highway network.
- 7.2.2 In addition, the quantum of the development proposals is reduced from what has been previously deemed acceptable. Therefore, there are no transport reasons why the development should not be granted planning consent.

## APPENDIX F

TRICS Output – Non-food Retail

**TRIP RATE CALCULATION SELECTION PARAMETERS:**

Land Use : 01 - RETAIL  
 Category : G - OTHER INDIVIDUAL NON-FOOD SUPERSTORE

**MULTI-MODAL VEHICLES**Selected regions and areas:

<b>04 EAST ANGLIA</b>	CA CAMBRIDGESHIRE	1 days
<b>05 EAST MIDLANDS</b>	LN LINCOLNSHIRE	1 days
<b>08 NORTH WEST</b>	CH CHESHIRE	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

**Primary Filtering selection:**

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area  
 Actual Range: 1000 to 1600 (units: sqm)  
 Range Selected by User: 290 to 5000 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/12 to 07/06/18

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Tuesday	1 days
Thursday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	3 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Town Centre	2
Edge of Town Centre	1

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Retail Zone	2
Built-Up Zone	1

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

**Secondary Filtering selection:**

Use Class:  
 A1 3 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

**Secondary Filtering selection (Cont.):**Population within 1 mile:

5,001 to 10,000	1 days
20,001 to 25,000	1 days
25,001 to 50,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	1 days
50,001 to 75,000	1 days
125,001 to 250,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.5 or Less	1 days
0.6 to 1.0	1 days
1.6 to 2.0	1 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Petrol filling station:

Included in the survey count	0 days
Excluded from count or no filling station	3 days

This data displays the number of surveys within the selected set that include petrol filling station activity, and the number of surveys that do not.

Travel Plan:

No	3 days
----	--------

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	3 days
-----------------	--------

This data displays the number of selected surveys with PTAL Ratings.

22:00 - 23:00									
23:00 - 24:00									
Total Rates:		12.885			13.324			26.209	

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

**Parameter summary**

Trip rate parameter range selected:	1000 - 1600 (units: sqm)
Survey date date range:	01/01/12 - 07/06/18
Number of weekdays (Monday-Friday):	3
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

Land Use : 01 - RETAIL

Category : G - OTHER INDIVIDUAL NON-FOOD SUPERSTORE

**MULTI-MODAL VEHICLES**Selected regions and areas:**06 WEST MIDLANDS**

WO WORCESTERSHIRE 1 days

**07 YORKSHIRE & NORTH LINCOLNSHIRE**

NY NORTH YORKSHIRE 1 days

**09 NORTH**

TV TEES VALLEY 1 days

*This section displays the number of survey days per TRICS® sub-region in the selected set***Primary Filtering selection:***This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.*

Parameter: Gross floor area

Actual Range: 2000 to 4181 (units: sqm)

Range Selected by User: 290 to 5000 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/09 to 07/06/18

*This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.*Selected survey days:

Saturday 3 days

*This data displays the number of selected surveys by day of the week.*Selected survey types:

Manual count 3 days

Directional ATC Count 0 days

*This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.*Selected Locations:

Edge of Town Centre 1

Suburban Area (PPS6 Out of Centre) 1

Edge of Town 1

*This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.*Selected Location Sub Categories:

Retail Zone 2

Built-Up Zone 1

*This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.***Secondary Filtering selection:**Use Class:

A1 3 days

*This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.*

**Secondary Filtering selection (Cont.):**Population within 1 mile:

1,000 or Less	1 days
5,001 to 10,000	1 days
15,001 to 20,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

100,001 to 125,000	1 days
125,001 to 250,000	1 days
250,001 to 500,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	1 days
1.1 to 1.5	2 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Petrol filling station:

Included in the survey count	0 days
Excluded from count or no filling station	3 days

This data displays the number of surveys within the selected set that include petrol filling station activity, and the number of surveys that do not.

Travel Plan:

No	3 days
----	--------

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	3 days
-----------------	--------

This data displays the number of selected surveys with PTAL Ratings.

22:00 - 23:00									
23:00 - 24:00									
Total Rates:		23.366			23.407			46.773	

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

The survey data, graphs and all associated supporting information, contained within the TRICS Database are published by TRICS Consortium Limited ("the Company") and the Company claims copyright and database rights in this published work. **Parameter summary**

Trip rate parameter range selected:	2000 - 4181 (units: sqm)
Survey date date range:	01/01/09 - 07/06/18
Number of weekdays (Monday-Friday):	0
Number of Saturdays:	3
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	1

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

14:00 - 15:00									
15:00 - 16:00									
16:00 - 17:00									
17:00 - 18:00									
18:00 - 19:00									
19:00 - 20:00									
20:00 - 21:00									
21:00 - 22:00									
22:00 - 23:00									
23:00 - 24:00									
Total Rates:		0.000			0.000			0.000	

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

## APPENDIX G

TRICS Output – Retail / Food Superstore

**TRIP RATE CALCULATION SELECTION PARAMETERS:**

Land Use : 01 - RETAIL  
 Category : A - FOOD SUPERSTORE

**MULTI-MODAL VEHICLES**Selected regions and areas:

<b>01 GREATER LONDON</b>		
BT BRENT	1 days	
KN KENSINGTON AND CHELSEA	1 days	
<b>04 EAST ANGLIA</b>		
CA CAMBRIDGESHIRE	1 days	
<b>05 EAST MIDLANDS</b>		
LE LEICESTERSHIRE	1 days	
<b>06 WEST MIDLANDS</b>		
WK WARWICKSHIRE	2 days	
<b>09 NORTH</b>		
CB CUMBRIA	1 days	

This section displays the number of survey days per TRICS® sub-region in the selected set

**Primary Filtering selection:**

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Parking spaces  
 Actual Range: 286 to 564 (units: )  
 Range Selected by User: 40 to 833 (units: )

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/12 to 28/06/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday	2 days
Wednesday	1 days
Thursday	1 days
Friday	3 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	7 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Town Centre	1
Edge of Town Centre	1
Suburban Area (PPS6 Out of Centre)	1
Edge of Town	3
Neighbourhood Centre (PPS6 Local Centre)	1

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Development Zone	1
Residential Zone	3
Retail Zone	1
Built-Up Zone	2

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

**Secondary Filtering selection:**Use Class:

A1	7 days
----	--------

*This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.*

Population within 1 mile:

5,001 to 10,000	3 days
10,001 to 15,000	1 days
20,001 to 25,000	1 days
25,001 to 50,000	1 days
100,001 or More	1 days

*This data displays the number of selected surveys within stated 1-mile radii of population.*

Population within 5 miles:

25,001 to 50,000	1 days
50,001 to 75,000	1 days
75,001 to 100,000	2 days
250,001 to 500,000	1 days
500,001 or More	2 days

*This data displays the number of selected surveys within stated 5-mile radii of population.*

Car ownership within 5 miles:

0.6 to 1.0	4 days
1.1 to 1.5	2 days
1.6 to 2.0	1 days

*This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.*

Petrol filling station:

PFS is present at the site and is included in the count	7 days
PFS is present at the site but is excluded from the count	0 days
There is no PFS at the site	0 days

*This data displays the number of surveys within the selected set that include petrol filling station activity, and the number of surveys that do not.*

Travel Plan:

Yes	1 days
No	6 days

*This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.*

PTAL Rating:

No PTAL Present	5 days
5 Very Good	2 days

*This data displays the number of selected surveys with PTAL Ratings.*

20:00 - 21:00	7	441	0.440	7	441	0.487	7	441	0.927
21:00 - 22:00	6	451	0.264	6	451	0.347	6	451	0.611
22:00 - 23:00	1	389	0.129	1	389	0.208	1	389	0.337
23:00 - 24:00	1	389	0.069	1	389	0.129	1	389	0.198
Total Rates:		9.561			9.598				19.159

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

The survey data, graphs and all associated supporting information, contained within the TRICS Database are published by TRICS Consortium Limited ("the Company") and the Company claims copyright and database rights in this published work. **Parameter summary**

Trip rate parameter range selected:	286 - 564 (units: )
Survey date date range:	01/01/12 - 28/06/19
Number of weekdays (Monday-Friday):	7
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Total Rates:			0.106			0.107			0.213

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

<b>09</b>	<b>NORTH</b>	
TW	TYNE & WEAR	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

**Primary Filtering selection:**

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Parking spaces  
 Actual Range: 272 to 592 (units: )  
 Range Selected by User: 40 to 833 (units: )

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/12 to 28/06/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Saturday 9 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	9 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Suburban Area (PPS6 Out of Centre)	2
Edge of Town	7

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Commercial Zone	1
Development Zone	1
Residential Zone	3
No Sub Category	4

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

**Secondary Filtering selection:**Use Class:

A1	9 days
----	--------

*This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.*

Population within 1 mile:

5,001 to 10,000	2 days
10,001 to 15,000	2 days
15,001 to 20,000	2 days
20,001 to 25,000	1 days
25,001 to 50,000	2 days

*This data displays the number of selected surveys within stated 1-mile radii of population.*

Population within 5 miles:

5,001 to 25,000	1 days
50,001 to 75,000	1 days
75,001 to 100,000	2 days
125,001 to 250,000	4 days
250,001 to 500,000	1 days

*This data displays the number of selected surveys within stated 5-mile radii of population.*

Car ownership within 5 miles:

0.5 or Less	1 days
0.6 to 1.0	2 days
1.1 to 1.5	5 days
1.6 to 2.0	1 days

*This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.*

Petrol filling station:

PFS is present at the site and is included in the count	9 days
PFS is present at the site but is excluded from the count	0 days
There is no PFS at the site	0 days

*This data displays the number of surveys within the selected set that include petrol filling station activity, and the number of surveys that do not.*

Travel Plan:

Yes	2 days
No	7 days

*This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.*

PTAL Rating:

No PTAL Present	9 days
-----------------	--------

*This data displays the number of selected surveys with PTAL Ratings.*

23:00 - 24:00									
Total Rates:			11.140			11.151			22.291

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

The survey data, graphs and all associated supporting information, contained within the TRICS Database are published by TRICS Consortium Limited ("the Company") and the Company claims copyright and database rights in this published work. **Parameter summary**

Trip rate parameter range selected:	272 - 592 (units: )
Survey date date range:	01/01/12 - 28/06/19
Number of weekdays (Monday-Friday):	0
Number of Saturdays:	9
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Total Rates:			17.454			17.389			34.843

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.

These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP\*FACT. Trip rates are then rounded to 3 decimal places.
