CBRE

Legal Notice and Disclaimer

This Phase I Environmental Assessment (the "Report") has been prepared by CBRE Limited ("CBRE") exclusively for Taylor Wimpey West London Ltd (the "Client") in accordance with the terms of engagement entered into between CBRE and the Client dated 19 February 2020 ("the Instruction"). The Report is confidential to the Client and any other Addressees named herein and the Client and the Addressees may not disclose the Report unless expressly permitted to do so under the Instruction.

Where CBRE has expressly agreed (by way of a reliance letter) that persons other than the Client or the Addressees can rely upon the Report (a "Relying Party" or "Relying Parties") then CBRE shall have no greater liability to any Relying Party than it would have if such party had been named as a joint client under the Instruction.

CBRE's maximum aggregate liability to the Client, Addressees and to any Relying Parties howsoever arising under, in connection with or pursuant to this Report and/or the Instruction together, whether in contract, tort, negligence or otherwise shall not exceed £5 million (five million pounds).

Subject to the terms of the Instruction, CBRE shall not be liable for any indirect, special or consequential loss or damage howsoever caused, whether in contract, tort, negligence or otherwise, arising from or in connection with this Report. Nothing in this Report shall exclude liability which cannot be excluded by law.

If you are neither the Client, an Addressee nor a Relying Party then you are viewing this Report on a non-reliance basis and for informational purposes only. You may not rely on the Report for any purpose whatsoever and CBRE shall not be liable for any loss or damage you may suffer (whether direct, indirect or consequential) as a result of unauthorised use of or reliance on this Report. CBRE gives no undertaking to provide any additional information or correct any inaccuracies in the Report.

None of the information in this Report constitutes advice as to the merits of entering into any form of transaction.

If you do not understand this legal notice then it is recommended that you seek independent legal advice.

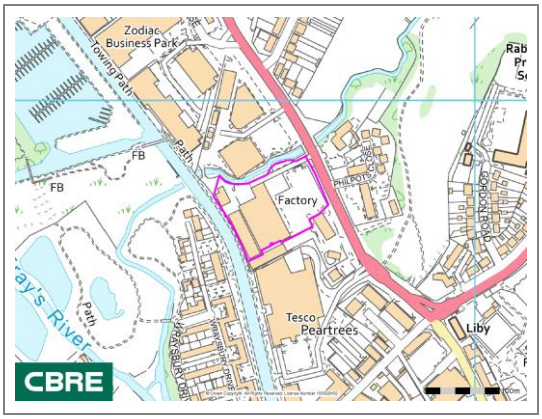

Executive Summary

Key Point Item	Status Comment
The Site	The site, which is irregular on plan and covers an area of approximately 1.24 hectares, comprises a mixed commercial retail and light industrial development, with the eastern and central part of the site (c.82% of the site area) supporting a detached retail warehouse unit that is occupied by B&M Bargains for the retail sale of household goods. The western part of the site (c.22% of the site area) comprises a vehicle body repair centre, currently occupied by D&B Crash Repairs, that includes a two storey office building and a high-bay warehouse building that houses paint spray booths and a number of vehicle repair stations. External parts of the site predominantly comprise hard surfaced parking and yard areas, with limited areas of infill and perimeter landscaping, including along the northern boundary of the site with the adjacent River Pinn. No potentially significant sources of contamination have been identified associated with current site uses. It is understood that a planning application is to be submitted for the redevelopment of the site following demolition of existing buildings, with the proposed scheme comprising a number of five and six storey buildings to provide a 10,000 sqft D1 Health Facility and 235 residential apartments with associated parking, communal podium garden, landscaping, pedestrian and cycle canal link, and external works.
Environmental Setting	The site is situated in an area of high sensitivity with respect to controlled water resources due to the underlying high intergranular permeability River Terrace Deposits (RTD, classified as a Principal Aquifer) and presence of the River Pinn along the northern site boundary. Surface water drainage generated on site discharges to the River Pinn. The site is located in an area of low sensitivity with respect to environmentally sensitive land uses, due to the absence of ecologically protected areas within a 1km radius.
Site History	The site has an industrial history, having previously supported a factory and other works of unspecified use. The main factory, principally occupying the eastern and central part of the site, was initially operated as a coachworks and for the manufacture of glass fibre components (c.1952 to early 1970s), and latterly as a refrigeration works and photo material works (early 1970s to early 1990s). The eastern and central part of the site was redeveloped to support the current retail warehouse in the 1990s; albeit, no information has been obtained concerning the investigation and, where necessary, remediation of ground contamination at the point of development.
The Surrounds	The immediate surrounds have had a similar use to the subject site, supporting a mix of commercial and industrial land uses. Potentially contaminative land uses identified in the immediate surrounding area include various garages/petrol filling stations (from adjacent south-east and west), various works, factories and light industrial units (from adjacent south and west, c.10m north, c.215m south-east and c.230m

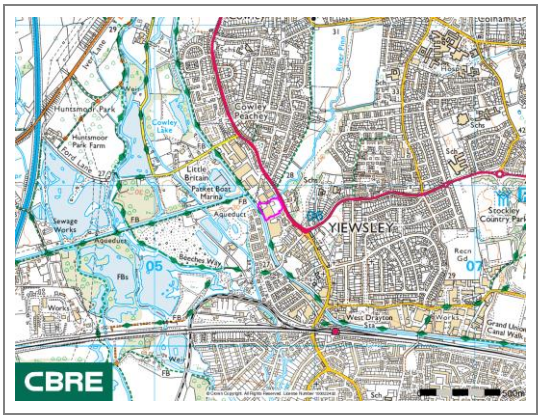

Executive Summary

	south), a builder's yard (c.15m east), a depot with above ground tanks (c.50m north) and a landfill (from c.120m north-west). However, a number of the potentially contaminative land uses located in the immediate vicinity have since been redeveloped into the predominance of commercial and residential land uses present today, with assessment and, where necessary, remediation of ground contamination completed in a number of instances. Where appropriate remediation has been completed the potential for the former industrial uses to comprise potentially significant off-site sources of contamination is reduced.
Overall Assessment	In line with current UK guidelines, and based on the findings of the Phase I Assessment, a qualitative assessment of the risks associated with ground conditions at the site, and in the surrounding area, has been undertaken using the "source-pathway-receptor" scenario to allow the formulation of a conceptual model. Eight plausible pollutant linkages have been identified between possible site derived contamination and future site users (via direct contact in landscaped areas, vapour generation, accumulation within buildings and permeation into potable water supply pathways), trees/plants (via uptake of phytotoxic contaminants from shallow soils), groundwater receptors (Principal Aquifer of the RTD, via vertical migration and leaching), surface water receptors (River Pinn, via lateral migration through soil and preferential pathways) and third party land users (via lateral and preferential migration), and possible off-site derived contamination and future site users (via lateral migration of vapours, ingress, accumulation and subsequent asphyxiation/explosive risk). CBRE considers that there is a **medium** risk of the site representing a significant risk to human health in the context of the proposed redevelopment of the site for a residential and commercial end use. However, where these risks are appropriately investigated and addressed through pre-development remediation and/or the incorporation of risk mitigation measures, as necessary, it is considered that the overall risks can be satisfactorily reduced to low and the site made suitable for its intended use.
Additional Investigation & Testing	In order to further confirm the contamination status of the site, and the consequent existence of associated risks in the context of the proposed redevelopment, it is recommended that an appropriately targeted Phase II intrusive ground investigation is completed. It is anticipated that such an investigation will be required as a condition of any planning consent granted for redevelopment. Given the age of the buildings on site present within the D&B Crash Repairs demise the potential for asbestos containing materials (ACM) to be present within the building fabric cannot be discounted. A Refurbishment/Demolition Asbestos Survey will be required prior to the proposed redevelopment of the site.

1.0 Introduction

Site Layout Plan
(©Landmark Information Group Limited 2020)

Site Location Plan
(©Landmark Information Group Limited 2020)

1.1 Background

Taylor Wimpey West London Limited (the "Client") instructed the Environmental Risk team of CBRE Limited (CBRE) to undertake a Phase I Environmental Assessment of 217 High Street, Yiewsley, West Drayton, UB7 7GN (the "site").

The site supports two adjacent but separate demises, which together comprise an area of 1.24 hectares. The eastern and central part of the site houses a retail warehouse store whilst the west supports a vehicle repair and MOT testing facility.

It is understood that the Client is seeking to bring forward a planning application for the redevelopment of the site following demolition of existing buildings that will comprise the erection of five and six storey buildings to provide a 10,000 sqft D1 Health Facility and 235 residential apartments with associated parking, communal podium garden, landscaping, pedestrian and cycle canal link, and external works. Proposed development plans are attached hereto as Appendix A.

The report should be read in conjunction with the Risk Classifications, Glossary and Report Qualifications attached hereto as Appendix D, E and F.

1.2 Objectives

The purpose of this report is to assess the potential for soil and/or groundwater contamination, both at and in vicinity of the site, and assess its significance in terms of risks to human health and/or controlled waters in the context of the proposed redevelopment of the site for a residential and commercial end use.

Introduction

1.3 Scope of Works

The scope of works for the assessment was as follows:

- site inspection by an Environmental Consultant;
- review of historical data for the site and surroundings, including historical Ordnance Survey (OS) maps of the area;
- review of site geology, hydrogeology and hydrology from British Geological Survey (BGS) and Environment Agency (EA) aquifer designation (on-line) maps;
- review of third party environmental database (Landmark) and EA geographical information system maps (on-line) regarding licenses, pollution incidents and waste management facilities on, and in the vicinity of, the site;
- review of flood risk from EA 'Risk of Flooding from Rivers and Sea Map', 'Flood Map for Planning (Rivers and Sea)' and 'Risk of Flooding from Surface Water Map' on-line;
- correspondence and/or discussions with the Regulatory Authorities.

No sampling or analysis of soils, waters or other material was carried out as part of this assessment.

2.0 The Site and Surrounds

2.1 Introduction

A review of current land uses was completed through inspections of the two site demises completed by Francesca Athies and Edward Blackburn of CBRE on 14 August 2018 (B&M Bargains) and 1 June 2019 (D&B Crash Repairs), discussions held with tenant representatives, and a review of information available in the public domain. This has enabled an assessment to be made of the potential for ground contamination associated with current activities, both on-site and in the surrounding area.

2.2 The Site

The site is located to the west of the High Street on the southern bank of the River Pinn in Yiewsley, West London, at national grid reference TQ 057 808. According to site-specific topographic survey collected by CBRE in August 2018, the site slopes from an elevation of approximately 29.5m Above Ordnance Datum (AOD) in the east to approximately 28.7m AOD in the west.

The site, which is irregular on plan and covers an area of approximately 1.24 hectares, comprises two adjacent demises supporting mixed commercial retail and light industrial uses, with the eastern and central part of the site (c.82% of the site area) comprising a detached retail warehouse unit that is occupied by B&M Bargains for the retail sale of household goods. The building provides an open plan sales area, with staff offices and welfare accommodation located along the southern elevation. A loading area with full height roller shutter door is located to the north-western elevation of the unit, providing access to a rear, concrete surfaced, service yard. An enclosed garden centre is located to the north-east of the unit. The remaining external areas primarily provide a tarmacadam surfaced staff and customer car park.

The western part of the site (c.18% of the site area) comprises a vehicle body repair and MOT testing centre, currently occupied by D&B Crash Repairs, and includes a two storey office building in the north and a high-bay warehouse building in the south, along with associated yard areas. The office building houses a main reception, office and welfare facilities, whilst the warehouse houses two fully enclosed paint spray booths and a number of work stations, with associated vehicle lifts, used for vehicle repair. An MOT test area, including a hydraulic vehicle lift and dynamometer 'rolling road', is located in the north of the warehouse. A small plant room, housing compressors, is located along the western elevation of the warehouse, with a paint store in the north of the building. Storage is provided on a mezzanine floor that has been installed in the north of the building. The spray booths are fitted with fume extraction systems that include gas-fired burner units to remove volatile organic compounds (VOC). External areas predominantly comprise a tarmacadam surfaced yard area located to the north and east of the office building and between the office building and warehouse. A paved emergency egress route is located to the east of the warehouse. The external areas are predominantly utilised for the storage of vehicles awaiting repair or customer collection, with a waste storage area in the north-eastern corner and a vehicle wash area to the south of the office building.

The two demises are separated by metal fencing.

The Site and Surrounds

Vehicular access to the car park, garden centre, service yard and vehicle repair facility is obtained via a shared service road aligned along the northern site boundary, which leads from High Street to the east. The building footprint and areas of hard-standing (i.e. car park, garden centre and service yard) cover >95% of the site area. The remainder of the site (i.e. <5% of the site area) is given over to landscaped areas; including raised plantings to the car park, and shrub and tree screens to the High Street (east) and River Pinn (north) site boundaries.

Paint Spray Booths, D&B Crash Repairs
(Source: CBRE)

2.3 Key Observations from the Site Reconnaissance

Bulk Storage of Fuel and Hazardous Materials

The site contacts were unaware of any current underground or aboveground bulk storage of fuel and/or hazardous material on site. No evidence of any underground or aboveground storage tanks (e.g. unexplained manhole covers, vents, fill points, bunds etc.) was noted at the time of the reconnaissance.

The above ground storage of hazardous materials is undertaken within the D&B Crash Repairs demise, as follows:

- Paints, primers and thinners used in the repair and respraying of vehicles are stored within a variety of containers ranging in size from c.1 – 25L within the paint store located in the north of the warehouse building. Similar sized containers containing oil, degreasers, traffic film remover (TFR) and anti-freeze (ethyl glycol) were also noted to be stored at the various work stations located throughout the warehouse.
- Four 205L drums and smaller containers (c.5 - 25L capacity) indicated to contain waste paint/lacquers/primers were noted to be stored to the north of the office building and in a dedicated waste store in the north-east of the site. The site contact indicated that the drums in the north of the site were awaiting transfer to the waste storage area prior to collection by the appointed waste contractor, Safetykleen. Two wheelie bins containing small paint containers, paint/oil soiled rags and waste oil filters were also present in this area. No secondary containment was observed associated with the storage of these materials, with minor staining identified in the vicinity of the containers. The underlying hard surfacing was observed to be in good condition, which reduces the potential for ground contamination to occur, albeit the waste storage area is

The Site and Surrounds

located in proximity to the River Pinn, which flows adjacent to the north of the site (see below).

- A 205L drum and several smaller containers (5 – 20L) indicated to contain detergent, wax, 'tyre shine' and TFR and associated with vehicle washing activities were noted in a storage shed located along the southern elevation of the office building. No secondary containment was observed associated with the storage of these materials, with minor staining identified in the vicinity of the containers. The underlying hard surfacing was observed to be in good condition, which reduces the potential for ground contamination to occur.

No significant bulk storage of hazardous materials was noted within the B&M Bargains demise, with only small quantities (<20L) of hazardous chemicals, namely paints and household cleaning products, stored for sale on racking or stacked on the shop floor within the unit. No issues were identified associated with the storage of these materials (e.g. evidence of staining or leakage).

Deleterious Materials

Asbestos containing materials (ACM) were previously widely used within the UK by manufacturers and builders. From the 1970s, there was increasing concern about the dangers of asbestos, with its use phased out during the 1990s and banned entirely by 1999.

A Refurbishment and Demolition Asbestos Survey was undertaken for the retail warehouse prior to occupation by B&M in May 2012. The report, which is held on site by the tenant, was prepared by Walker & Turpin Consultants Ltd (report reference S4625) and did not identify any suspected ACM within the building. A critical review of the competence or technical quality of the asbestos survey has not been completed by CBRE as part of this assessment. No asbestos register or survey was held for the buildings within the D&B Crash Repairs demise. Suspected asbestos cement sheeting was identified to comprise the roofing materials of the northern office building. Given the age of the buildings on site the potential for ACM to be present elsewhere cannot be discounted.

The site is provided with mains power supply. A Regional Electricity Company (REC) sub-station is located within a compound, adjacent to the River Pinn, in the north of the site. The sub-station is anticipated to date from the development of the unit (i.e. mid 1990s) and where this is the case it is unlikely to utilise polychlorinated biphenyl (PCB) containing oils. Furthermore, responsibility for any ground contamination associated with the sub-station would be anticipated to lie with the REC in the first instance.

Water and Waste Water

The buildings on site are connected to mains water supply (i.e. there are no groundwater abstraction wells operated on site). Sanitary wastewater and surface water run-off (from the roof and external areas) are generated on site.

In addition, trade effluent comprising waste water associated with vehicle washing activities is currently produced within the D&B Crash Repairs demise. Run-off from vehicle washing discharges directly to surface drainage. A drainage plan for the site was not available for review; however, surface water run is understood to discharge to the adjacent River Pinn, whilst sanitary wastewater is anticipated to discharge off site separately to the mains network. The site contacts were not aware of any oil-

The Site and Surrounds

water interceptors within the drainage system, nor was any evidence of one noted at the time of the reconnaissance (i.e. three consecutive manhole covers, vents etc.).

Invasive Species

No suspected Japanese Knotweed, Giant Hogweed or Himalayan Balsam, as types of invasive weeds, were identified on site, although a habitat survey was not completed as part of this assessment and full inspection of the western boundary (with the adjacent Grand Union Canal) could not be inspected.

Additional Information

The site contacts were unaware of any further environmental issues associated with the site or surrounding properties.

2.4 The Surrounds

The site lies within an area of predominantly mixed commercial and residential use. The Grand Union Canal is located adjacent to the west, with residential properties and open land beyond (c.30m). The River Pinn flows adjacent to the north-eastern boundary of the site, with further retail warehouse units c.15m north, and the trade counter units of Zodiac Business Park beyond. A Tesco superstore and the operational Shell Yiewsley petrol filling station (PFS) are present from c.10m south and adjacent south-east respectively, with residential properties present from c.60m south-east and on the opposite side of the High Street (c.20m east). In addition to the Shell Yiewsley PFS, there is also a record within the third party environmental database of an obsolete PFS, known as the Falling Lane Service Station, located c.170m south-east. The obsolete PFS is now operated as a car sales facility.

There are no records of environmentally sensitive land uses, e.g. Special Areas of Conservation (SAC), Sites of Special Scientific Interest (SSSI), Areas of Outstanding Natural Beauty (AONB) or local nature reserves etc., located within a 1km radius.

2.5 Environmental Databases

According to a publicly available third-party environmental database there are no records of any historical/operational landfills on site, with one record of a landfill within a 250m radius (i.e. within the Planning Consultation Zone). The record relates to a former landfill, located from c.125m north-west, which was operated by the British Waterways Board between December 1890 and December 1996. The landfill is understood to have accepted inert, commercial, household and liquid sludge waste. The area has since been redeveloped to support Packet Boat Marina. Given the types of waste deposited (i.e. putrescible) there is a potential for the generation of ground gas (e.g. methane and carbon dioxide) and leachate (i.e. potentially contaminated groundwater). However, the presence of the intervening Grand Union Canal and River Pinn between the landfill and site may act as a hydraulic break/impede the potential for ground contamination to migrate onto the site.

Additionally, with exception of an Environmental Permit to operate a Part B process, there are no records of any Environmental Permits, including waste management facilities, Part A(1) or A(2) installations and/or for the keeping, use and disposal of

The Site and Surrounds

radioactive substances[1] on site, or within a 250m radius. The one record of a current Environmental Permit to operate a Part B process within 250m of the site is held by Shell Yiewsley PFS, adjacent south-east, pertaining to vapour extraction processes associated with the bulk storage and retail sale of fuel (PG1/14)[2].

A copy of the third-party environmental database (Landmark) is attached hereto as Appendix B.

2.6 Potential for Current Contamination

The site comprises a mixed commercial and light industrial development supporting a retail warehouse and car repair facility. The storage and use of a range of potentially hazardous substances, including paints, lacquers, primers, oil and degreasers, is undertaken within the D&B Crash Repairs demise associated with current vehicle repair activities. No significant issues were identified associated with these uses; albeit, waste containers were noted to be stored in proximity to the River Pinn without the benefit of secondary containment to contain any leaks/spills. Nevertheless, the potential for ground contamination to have occurred is limited.

The site lies within an area of predominantly mixed commercial and residential use, typical of a urban environment. Potentially contaminative land use identified in the immediate surrounds is limited to an operational PFS adjacent south-east of the site. A former landfill is also located c.120m north-west; albeit, this has largely been redeveloped and the Grand Union Canal and/or River Pinn may act as a barrier against the migration of contamination (including ground gases) onto the subject site.

The potential for any ground contamination to migrate onto the site from off-site sources is further discussed in the following section.

[1] Due to public security restrictions, certain information on closed or mobile radioactive substance authorisations has been removed from the public register.
[2] It is noted that two further Part B Environmental Permits are listed within a 250m radius of the site. However, one of these permits, issued to New Pro Foundries, is registered to an address which is actually >1km south-east, and the second permit, issued to Swan Motors, is assumed to no longer be operational, with the garage and many of the units on the surrounding industrial estate destroyed by fire in 2011.

3.0 Geology, Hydrogeology and Hydrology

3.1 Introduction

Desk-based research of the local geology, hydrogeology and hydrology was carried out in order to establish the potential migration pathways (onto or away from the site) and likely receptors (i.e. the surface water and groundwater sensitivity of the site area).

3.2 Geology

According to the BGS 1:50,000 Solid and Drift map of the area (BGS Sheet 255, Beaconsfield) and local BGS borehole logs[3], the site is underlain by superficial deposits of the Langley Silt Member (comprising sandy clays and silt, anticipated to be <5m thick) and, in turn, River Terrace Deposits (RTD, comprising sandy gravelly clay and clayey gravel, locally logged to 5.2m thick). Although not mapped, superficial deposits of Alluvium may also be present in the vicinity of the River Pinn in the north/north-east of the site. Given the developed location of the site the ground will have been disturbed and a nominal thickness of Made Ground (MG, i.e. fill material) should be anticipated beneath the site, and surrounding area. Development of the site may also have resulted in the removal, either entirely or in part, of the Langley Silt deposits.

The superficial deposits are underlain by the solid geology of the London Clay (comprising silty clay, locally logged to >26m thick), which, in turn, are underlain by the Lambeth Group (clay, silt and sand, c.25m thick) and the Chalk Group (chalk, to depth).

The site is not located within a coal mining area of the UK. There is no mapped evidence of historical shallow ground workings on site, with a single record of former workings within a 250m radius. The record relates to the former Cowley Peachey Brickfield, operated from approximately 125m north-west, which have subsequently been landfilled and redeveloped (see Section 2). There are a number of other areas in the wider surrounds that are indicated on published geological mapping to comprises areas of filled/made ground where the Langley Silt is anticipated to have been removed, principally for brick manufacturing purposes.

The site is located within a lower probability radon area where less than 1% of residential properties are above the action level of 200Bq/m^3 for radon set by Public Health England. No radon protective measures are considered necessary by the BGS in the construction of new dwellings or extensions.

3.3 Hydrogeology

The superficial deposits of the RTD are of variable but generally high intergranular permeability (classified as a 'Principal' Aquifer), which are anticipated to be water-bearing. The superficial deposits of the Langley Silt Member, where present, and the solid geology of the London Clay have a low to negligible permeability (classified as 'Unproductive Strata'), which would tend to restrict groundwater flow, including vertically to the regionally important aquifer of the Chalk Group (also classified as a Principal Aquifer).

[3] Contains BGS materials © NERC 2020

Geology, Hydrogeology and Hydrology

The water quality of the Lower Thames Gravels regional aquifer has been classified by the EA under their River Basin Management Plan (RBMP) as being of 'good' quantitative and chemical status.

According to a publicly available third-party environmental database, there are no licensed groundwater abstractions recorded within a 1km radius of the site.

According to an EA data source, the site is not located within a currently designated groundwater Source Protection Zone (SPZ).

3.4 Hydrology

The nearest identified surface watercourses to site include the River Pinn, which flows along then northern boundary of the site, and the Grand Union Canal, which lies adjacent west. The River Pinn flows underneath the Grand Union Canal in an inverted siphon, approximately 20m north-west, and subsequently joins the Frays River, a distributary of the River Colne. The River Colne and its various distributaries flow in a predominantly southerly direction past the site, and surrounds, beyond the Grand Union Canal.

The water quality of the River Pinn has been classified by the EA under their River Basin Management Plan (RBMP) as being of 'moderate' ecological potential and 'good' chemical status.

According to a publicly available third-party environmental database, there is a single licensed surface water abstraction located onsite, with no other abstractions noted within a 1km radius of the site. The abstraction is recorded as being operated by British Waterways Board, from the River Pinn (adjacent to the northern boundary of site), for cooling purposes at the Middlesex Oil and Chemical Works. It is not clear whether this relates to a former industrial facility located on the subject site (see Section 4). However, the works is no longer in operation and the abstraction is therefore anticipated to be no longer be active.

A single pollution incident has been recorded on the subject site, whilst a further nine pollution incidents have been recorded within a 250m radius of the site. The onsite pollution incident involved the release of oils to an unknown waterbody (anticipated to be the River Pinn) in December 1993, and was categorised by the EA as a 'minor' (Category 3) incident, and therefore of no significant impact to the environment. Two of the nine offsite incidents, which occurred c.25m north and c.85m south and involved the loss of oils to a surface watercourse, were categorised by the EA as 'significant' (Category 2). The remaining offsite incidents were categorised by the EA as 'minor' (Category 3) and therefore were also of no significant impact to the environment.

3.6 Significance of Geology, Hydrogeology and Hydrology

The site is situated in an area of high sensitivity with respect to groundwater resources due to the variable but generally high intergranular permeability of the underlying RTD, which are classified as a Principal Aquifer.

Shallow groundwater within the RTD may provide a pathway for shallow mobile contaminants (if any present) to migrate onto the site from off-site sources, or away from the site onto third party land. Groundwater flow is anticipated to be in continuity with the local watercourses, which may in the north of the site be in the

Geology, Hydrogeology and Hydrology

direction of the River Pinn (i.e. north/north-west) and across the wider site may be in the direction of the Frays River (i.e. west/south-west).

The site is situated in an area of high sensitivity in relation to surface water resources due to the presence of the River Pinn, along the northern boundary, with the possible discharge of surface water drainage into the watercourse.

4.0 Site History

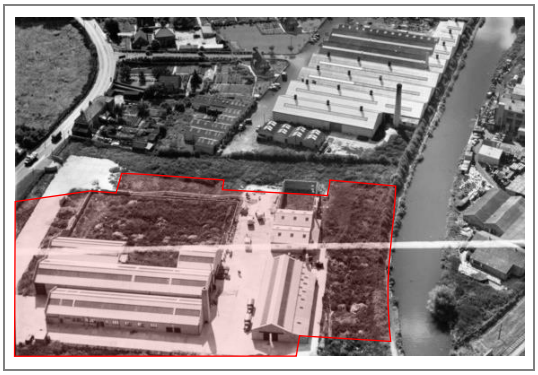

4.1 Introduction

A review of the previous land uses at the site was carried out by inspecting historical maps and through contact with the Regulatory Authorities. This has enabled an assessment to be made of the potential for ground contamination associated with former activities, both on-site and in the surrounding areas. Selected extracts of historical Ordnance Survey (OS) maps are attached hereto as Appendix C.

4.2 Review of Historical Maps

The historical development of the site is summarised in the table below.

SITE USE	DATES
The site comprised undeveloped agricultural land (mapped as an orchard by 1896).	pre 1878 to pre 1964
The site had been redeveloped to support a factory. The main building occupied the centre of the site (c.55% of the site area) with a separate ancillary building and possible aboveground tank along the western site boundary (c.10% of the site area). Small ancillary structures were also mapped in the north-east, north-west and south-west of the site, including possibly the current office building within the D&B Crash Repairs demise.	pre 1964 to pre 1971
By 1971, the main factory building was annotated as a 'Refrigeration Works', with a building in the centre-west of the site annotated as a 'Photo Material Works' and those in the west labelled as a 'Warehouse' and the 'River Pinn Works'. The remaining ancillary structures appear to have been demolished. By 1986 the buildings in the centre and centre-west of the site were labelled as 'Works'.	pre 1971 to pre 1996
The site had been redeveloped into the general configuration present today, with the building in the north-west of the site remaining labelled as 'River Pinn Works'.	pre 1996 to present

© Britain from Above: View of Factory under Construction from the North (c.1951)

Anecdotal information suggests the factory on site was occupied by James Whitson & Co from c.1952 and manufactured coach and fire engines. During the 1960s, due to a decline in demand, the factory was altered to be used to manufacture glass fibre components for commercial vehicles[4].

[4] https://www.british-history.ac.uk/vch/middx/vol4/pp75-82

Site History

The environmentally pertinent historical uses from the immediate surrounding area (<250m) have been summarised in the table below:

SURROUNDING SITE USE	DATES	LOCATION
Railway Line/Embankment	pre 1885 to pre 1975 (disused by pre 1970)	adjacent north-west
then Light Industrial/Commercial Units	pre 1975 to present

Site History

Various Factories/Works/Printing Works/Joinery Works/Motor Repair Works and a Car Storage Yard of Rainbow & Kirkby Industrial Estates	pre 1964 to present	c.215m south-east and c.220m south

*The Taplin Trading Estate was subject to ground investigation under the planning regime as part of the redevelopment of the superstore (planning reference 60929/APP/2007/3744).

**The chemical works was subject to extensive ground investigation and remediation under the planning regime as part of the redevelopment of the housing estate (planning reference 335/APP/2006/2245).

4.3 Regulatory Authority Information

Planning Department

A planning history for the site has been obtained from the Planning Department of London Borough of Hillingdon (LBH). The earliest identified application for the site is dated August 1957 and relates to the replacement of a temporary building to a permanent brick building (planning reference 3161/1050A). The application was submitted on behalf of James Whitson & Co Ltd. Plans held within the file indicate that the main factory building comprised assembly areas, with a garage and part stores to the south, a paint shop, staff welfare and plant areas to the north and office areas to the east. Petrol and diesel pumps associated with the factory were located immediately off-site to the south-east, on land which has since been redeveloped to support the existing Shell Yiewsley PFS. A copy of the plans are attached hereto as Appendix C.

The existing retail warehouse unit was developed under a planning consent granted in July 1995 for the 'Erection of a DIY store and garden centre with associated parking and landscaping' (planning reference 41515B/93/606). The application was submitted on behalf of Focus DIY, who are understood to have originally occupied the unit. The application/consent references the site as 'Sadia Works' operated by Sadia Aerofreeze. No conditions specific to the assessment of contaminated land were imposed on the consent granted.

An application was then granted in January 2004 for the 'change of use of warehouse to workshop for vehicles repairs' (application reference: 3178/APP/2003/2806). Although no conditions were attached to planning in relation to the requirement of intrusive investigation works etc., conditions 8 and 11 were attached to the decision notice stating the requirement for spraying of vehicles within dedicated spray booths, and for the secure storage of all bulk fuels onsite, respectively.

The remaining planning applications listed for the site relate to the discharge of various conditions and for the installation of signage.

Environmental Health Department

The Contaminated Land Officer (CLO) for the LBH has confirmed that the site has not been designated as contaminated land under Part IIA of the Environmental Protection Act 1990, nor has the site been identified for further inspection under the councils contaminated land strategy.

The CLO additionally referenced the presence of two former landfills within the vicinity of site on of which was referenced in Section 2.5 (c.125m north-west of site), however the other refers to a former landfill c.70m west of site, named the River

Site History

Pinn, and is understood to have accepted construction waste from between 1978 and 1984.

A number of properties in the surrounding area have been identified for further review by the council, including the adjacent Shell Garage and two further garages (c.140m and c.170m south-east), although they are of low priority. It is understood the Tesco superstore (from c.10m south) was investigated and remediated through the planning process during redevelopment.

Environment Agency

A number of EA data sources have been reviewed by CBRE as part of the assessment. No issues have been identified that warrant further consultation.

Petroleum Licensing Authority

The petroleum licencing department of the London Fire Brigade has confirmed that they hold no records for the current or former storage of petroleum on the subject site.

4.4 Potential for Historical Contamination

The site has an industrial history, having previously supported a factory and other works of unspecified use. The main factory, principally occupying the eastern and central part of the site, was initially operated as a coachworks and for the manufacture of glass fibre components (c.1952 to early 1970s) and latterly as a refrigeration works and photo material works (early 1970s to early 1990s). The west of the site supported the River Pinn Works, with the nature of operations undertaken not confirmed. The eastern and central part of the site was redeveloped to support the current retail warehouse in the 1990s; albeit, no information has been obtained concerning the investigation and, where necessary, remediation of ground contamination at the point of development.

The immediate surrounds have had a similar use to the subject site, supporting a mix of commercial and industrial land uses. Potentially contaminative land uses identified in the immediate surrounding area include various garages/PFS (from adjacent south-east and west), various works, factories and light industrial units (from adjacent south and west, c.10m north, c.215m south-east and c.230m south), a builder's yard (c.15m east), a depot with aboveground tanks (c.50m north) and landfills (from c.120m north-west). However, a number of the potentially contaminative land uses located in the immediate vicinity have since been redeveloped into the predominance of commercial and residential land uses present today, with the assessment and remediation of ground contamination completed in a number of instances. Where appropriate remediation has been carried out the potential for the former industrial uses to comprise potentially significant off-site sources of contamination is reduced.

5.0 Conceptual Site Model

5.1 Introduction

In line with UK guidelines and based on the findings of the Phase I Environmental Assessment, a qualitative assessment of the risks associated with ground conditions at the site, has been undertaken in the formulation of a preliminary conceptual model (CM). This includes several scenarios, such as risk to future site users, building materials, users and occupants of neighbouring properties.

A CM is an essential element of any site-specific environmental risk assessment. In this context, it is often a simple representation of the hypothesised relationships between source, pathways and receptors. For the purpose of this report a preliminary CM has been developed based on the presentation and interpretation of information regarding the site, which has been gathered during production of the environmental report. This allows the identification of potential pollutant linkages and, therefore, an interpretation of the potential for significant harm and/or pollution of human health/controlled waters in relation to the site.

The CM has been developed based on the indicated proposals to redevelop the site to support mixed residential and commercial uses, with associated external landscaping and parking areas.

6.2 Sources

Soil

Potential sources of soil contamination on site have been identified associated with historical industrial uses of the site, including a factory and other works of unspecified use. As summarised in Section 4, the main factory was initially operated as a coachworks and for the manufacture of glass fibre components (c.1952 to early 1970s) and latterly as a refrigeration works and photo material works (early 1970s to early 1990s). The eastern and central part of the site was redeveloped to support the current retail warehouse in the 1990s and it is not known if any remediation was completed at the point of development.

Potential contaminants that may be present associated with historical operations include petroleum hydrocarbons (fuels and oils) associated with the operation and maintenance of machinery and plant (possibly including vehicles); VOC associated with coating, fibre glass manufacture and/or degreasing operations; polycyclic aromatic hydrocarbons (PAH), metals and asbestos associated with general MG and manufacturing activities; PCB associated with electrical plant and components; and acids/alkalis associated with manufacturing activities.

The immediate surrounding area is considered to have a similar industrial history to the subject site itself, having supported a number of potentially contaminative uses, including garages/PFS (from adjacent south-east and west), various works, factories and light industrial units (from adjacent south and west, c.10m north, c.215m south-east and c.230m south), a builder's yard (c.15m east), a depot with above ground tanks (c.50m north) and landfills (from c.120m north-west). A number of the potentially contaminative land uses located in the immediate vicinity have since been redeveloped into the predominance of commercial and residential land uses present today, with assessment and, where necessary, remediation of ground contamination completed in a number of instances. Where appropriate remediation has been completed the potential for the former industrial uses to comprise potentially significant off-site sources of contamination is reduced.

Conceptual Site Model

Potential contaminants associated with off-site industrial activities in the immediate surrounds depend of the nature of the works undertaken but are likely to be similar to those anticipated on-site.

Groundwater

The site is underlain by the Principal Aquifer of the superficial RTD and solid geology of the London Clay. Shallow groundwater within the RTD may provide a pathway for shallow mobile contaminants (if any present) to migrate onto the site from off-site sources or away from the site onto third party land and/or nearby surface water bodies. Consequently, there is the potential for groundwater to comprise a source of contamination, including vapours associated with volatile organics (i.e. light fraction petroleum hydrocarbons and/or other VOC), which may impact on and/or off-site receptors.

Ground Gas

There is no positive evidence of significant infilling activities having been undertaken on site; however, it is anticipated that a layer of MG deposits will underlie the site. Depending upon the thickness and composition of the MG it may also comprise a potential source of ground gas (i.e. methane and/or carbon dioxide).

As noted in Section 2, a former landfill has been identified c.125m north-west, which was operated by the British Waterways Board. The landfill is understood to have accepted inert, commercial, household and liquid sludge waste. The area has since been redeveloped to support Packet Boat Marina. Given the types of waste deposited (i.e. putrescible) there is a potential for the generation of ground gas (e.g. methane and carbon dioxide) and leachate (i.e. potentially contaminated groundwater); albeit, where development of the current marina has necessitated the excavation of landfilled materials the potential for residual contamination is reduced.

6.3 Receptors

The level of risk derived from contamination on site is determined by the nature of receptors susceptible to contamination and the pathways by which it may reach them. The key receptors identified in the context of the proposed commercial end use are as follows:

- Construction and maintenance workers, including during the redevelopment of the site;
- Future site users (i.e. residents and commercial users);
- Groundwater within the Principal Aquifer of the RTD[5];
- Surface water receptors, principally comprising the River Pinn;
- Uptake of contamination by plants/trees;
- Buildings and materials (i.e. water supply pipes); and
- Users/residents of neighbouring properties.

[5] The significant thickness of low permeability deposits of the London Clay would be anticipated to limit the potential for mobile contaminants, if present, to migrate to the regionally important aquifer of the Chalk Group present at depth.

Conceptual Site Model

6.4 Key Pathways

In order for a receptor to be at risk from a source of contamination, the receptor and source must be "linked" by a plausible migration pathway. Potential pathways between the sources and receptors are discussed in further detail below:

Direct Contact (i.e. oral/dermal) and Inhalation of Wind Blown Dust

- The future development will comprise hardstanding (building footprints and parking/access roads) across the majority of the site area, thereby limiting the potential for future site users to come into direct contact with soil contamination (if any) and limiting the creation of windblown dust. Where hotspots of contamination exist within the shallow soils in any proposed soft landscaping areas, which currently include the northern and north-western parts of the site aligned with the River Pinn, a risk of exposure may exist for future site users. However, such risks can be appropriately mitigated through the localised excavation of impacted soil(s) and/or capping with certified "clean" topsoil.
- In the event that hotspots of contaminants are present within the shallow soils beneath the site, they could be disturbed particularly during the maintenance/construction activities. However, risks to construction workers during construction and maintenance workers post-construction, can be mitigated through the use of appropriate health and safety measures and personal protection equipment (PPE).
- The risk is considered to be **low to medium** in the context of the proposed redevelopment of the site.

Volatilisation of Contaminants to Indoor Air from Soil and Ground Gas Ingress (i.e. inhalation)

- Potential sources of volatile organics (e.g. light fraction petroleum hydrocarbons and/or VOC) and, to a lesser degree, ground gases (i.e. carbon dioxide and methane) have been identified at the site. Where volatile organics and ground gases are present, vapours/gases could migrate into the proposed residential and commercial buildings (e.g. through cracks in the floor slab or service entry points). However, risks to future users associated with ground gas and vapours can be satisfactorily mitigated through the removal of residual sources and/or incorporation of appropriate gas/vapour protection measures into the design of new buildings.
- In the event that gases/vapours are present beneath the site, these could accumulate within trenches associated with construction works and in manholes, which if entered could result in impacts to maintenance workers. However, risks to construction workers may be mitigated through the use of monitoring equipment prior to entering confined spaces where gases/vapours could accumulate.
- The risk is considered to be **medium** in the context of the proposed redevelopment of the site, due to the sensitivity of the proposed residential end-use.

Uptake of Contaminants by Plants/Trees

- Potential sources of phytotoxic metals (e.g. nickel, copper and zinc) have been identified at the site. In the event that shallow soils beneath the site are impacted

Conceptual Site Model

with phytotoxic metals they could inhibit future plant growth. Risks to plants can be mitigated through the excavation of impacted soil(s) and/or use of suitable clean fill material to provide a growing medium.

- The risk is considered to be **low to medium** in the context of the proposed redevelopment.

Permeation of Potable Water Supply Pipes

- Where shallow soils beneath the site contain high concentrations of certain organic contaminants (e.g. petroleum hydrocarbons or phenols), there may be risks associated with the permeation of plastic water supply pipes. In the event that sources of organics are identified during redevelopment, the risks to building materials can be reduced through the removal of residual sources and correct selection of materials during construction.
- The risk is considered to be **medium** in the context of the proposed redevelopment of the site.

Leaching from Shallow Soils to the Principal Aquifer of the RTD

- Historic site uses may comprise a source of a range of potential contaminants that may leach from the unsaturated zone to shallow groundwater. Groundwater is anticipated to be present at shallow depths and sub-surface contaminants may be in direct contact with groundwater. The existing and proposed site layout includes a predominance of hard-standing, which should reduce the infiltration of precipitation on site and the potential for any residual contaminants within shallow soils to leach to groundwater. However, the proposed redevelopment of the site, including removal of hardstanding and completion of groundworks may mobilise residual contamination (where present). The surrounding area is considered to have a similar potential for contamination as the subject site itself, thereby reducing the possibility for the site to be identified as a unique source. Where present, risks to groundwater can be mitigated via excavation/treatment of residual contaminated soil and/or groundwater.
- The risk is considered to be **medium** in the context of the proposed redevelopment.

Lateral Migration of Impacted Groundwater and Via Surface Water Drainage to Surface Water Bodies

- The site is considered to be situated in an area of high sensitivity in relation to surface water resources given that the River Pinn is located adjacent to the northern site boundary. Due to the anticipated presence of a continuous body of shallow groundwater beneath the site, there is the potential for the migration of contaminants via groundwater to the River Pinn; albeit, the prevailing groundwater flow direction may be to the west/south-west due to the presence of the River Colne, into which the River Pinn and Frays River ultimately discharge. Additionally, the surrounding area is considered to have a similar potential for contamination as the subject site itself, thereby reducing the possibility for the site to be identified as a unique source. Where present, risks to the River Pinn can be mitigated via excavation/treatment of residual contaminated soil and/or groundwater.

Conceptual Site Model

- The current surface water drainage network is also understood to drain into the River Pinn and may also provide a pathway for mobile contaminants to the river.
- The risk is considered to be **low to medium** in the short to long term.

Lateral Migration On-Site and Off-Site of Impacted Groundwater and Inhalation of Vapours

- Risks may exist for site users from off-site sources of contamination may exist in relation to the inhalation of volatile organics generated by impacted shallow groundwater.
- Potential historical sources of volatile organics have been identified on site and in the surrounding area and shallow groundwater within the RTD may provide a pathway for shallow mobile contaminants (if any present) to migrate onto the site from off-site sources, or away from the site onto third party land. Groundwater flow is anticipated to be in continuity with the local watercourses, which may in the north of the site be in the direction of the River Pinn (i.e. north/north-west) and across the wider site may be in the direction of the Frays River (i.e. west/ south-west). Sensitive residential receptors are located to the west/south-west of the site. Risks posed to off-site receptors can be risks can be satisfactorily mitigated through the removal of residual sources, where necessary.
- Where volatile organics are present on-site associated with off-site sources, vapours could migrate into the proposed residential and commercial buildings (e.g. through cracks in the floor slab or service entry points). Groundwater is anticipated at shallow depth (i.e. <5m bgl) and therefore the potential for vapours to volatilise to surface cannot be discounted. The redevelopment of a number of identified potential off-site sources of contamination reduces the potential for residual impact. The risk to future users associated with vapours could be mitigated through the incorporation of appropriate vapour protection measures into the design of new buildings.
- In the event that vapours are present beneath the site, these could accumulate within trenches associated with construction works and in manholes post-development, which if entered could result in impacts to groundworkers. However, risks to construction workers may be mitigated through the use of monitoring equipment prior to entering confined spaces where gases could accumulate.
- The risk is considered to be **low to medium** in the short to long term.

Conceptual Site Model

Preferential Migration On-site and Off-site of Ground Gases and/or Wind Blown Dust

- Risks to future site users and residents of neighbouring properties may exist associated with the lateral migration of ground gas and subsequent ingress into, and accumulation within, buildings, and/or the ingestion of windblown dust.
- MG is anticipated to be present on site and whilst this may comprise a potential source of ground gases given the anticipated absence of significant filling the potential for active gas generation, which may migrate off-site to third party land, is reduced. The potential for ground gases to migrate onto site from the off-site landfill (located c.120m north-west) cannot be discounted, albeit the presence of the intervening Grand Union Canal and River Pinn between the landfill and site may act as a hydraulic break and limited the potential for ground gases to migrate onto the site.
- In light of the current predominance of hardstanding across the site the potential for the windblown migration of contaminated dust is considered to be limited. Risks to users of neighbouring premises during any redevelopment works can be mitigated through the implementation of appropriate mitigation measures, such as the use of hoarding around the perimeter of the working area and dust suppression/wheel wash facilities.
- Following redevelopment, risks associated with the wind-blown migration of contaminated dust can be adequately mitigated by the presence of hard surfaced areas and use of suitable clean fill material in landscaped areas.
- The risk is considered to be **low to medium** in the context of the proposed redevelopment of the site.

6.0 Conclusions & Recommendations

6.1 Conclusions

Based on the findings of the Phase I Environmental Assessment and the formulation of a CM eight plausible pollutant linkages have been identified at the site:

- Possible site derived contamination and site users (via direct contact (i.e. oral/dermal) and inhalation of windblown dust);
- Possible site derived contamination and site users (via vapour/ground gas generation, accumulation within buildings and subsequent inhalation);
- Possible site derived contamination and plants trees (via uptake of phytotoxic contaminants from shallow soils);
- Possible site derived contamination and site users (via permeation of potable water supply pipes);
- Possible site derived contamination and the underlying Principal Aquifer of the RTD (via leaching and vertical migration from shallow soils);
- Possible site derived contamination and surface water receptors comprising the River Pinn (via leaching and lateral migration within shallow groundwater and/or via drainage infrastructure);
- Possible site derived contamination and users of third party land (via lateral migration of ground gas/vapours, ingress, accumulation and inhalation/asphyxiation/explosive risk); and
- Possible off-site derived contamination and site users (via lateral migration of vapours, ingress, accumulation and inhalation/asphyxiation/explosive risk).

The overall risk is currently considered to be **medium** in the context of the proposed redevelopment of the site.

6.2 Recommendations

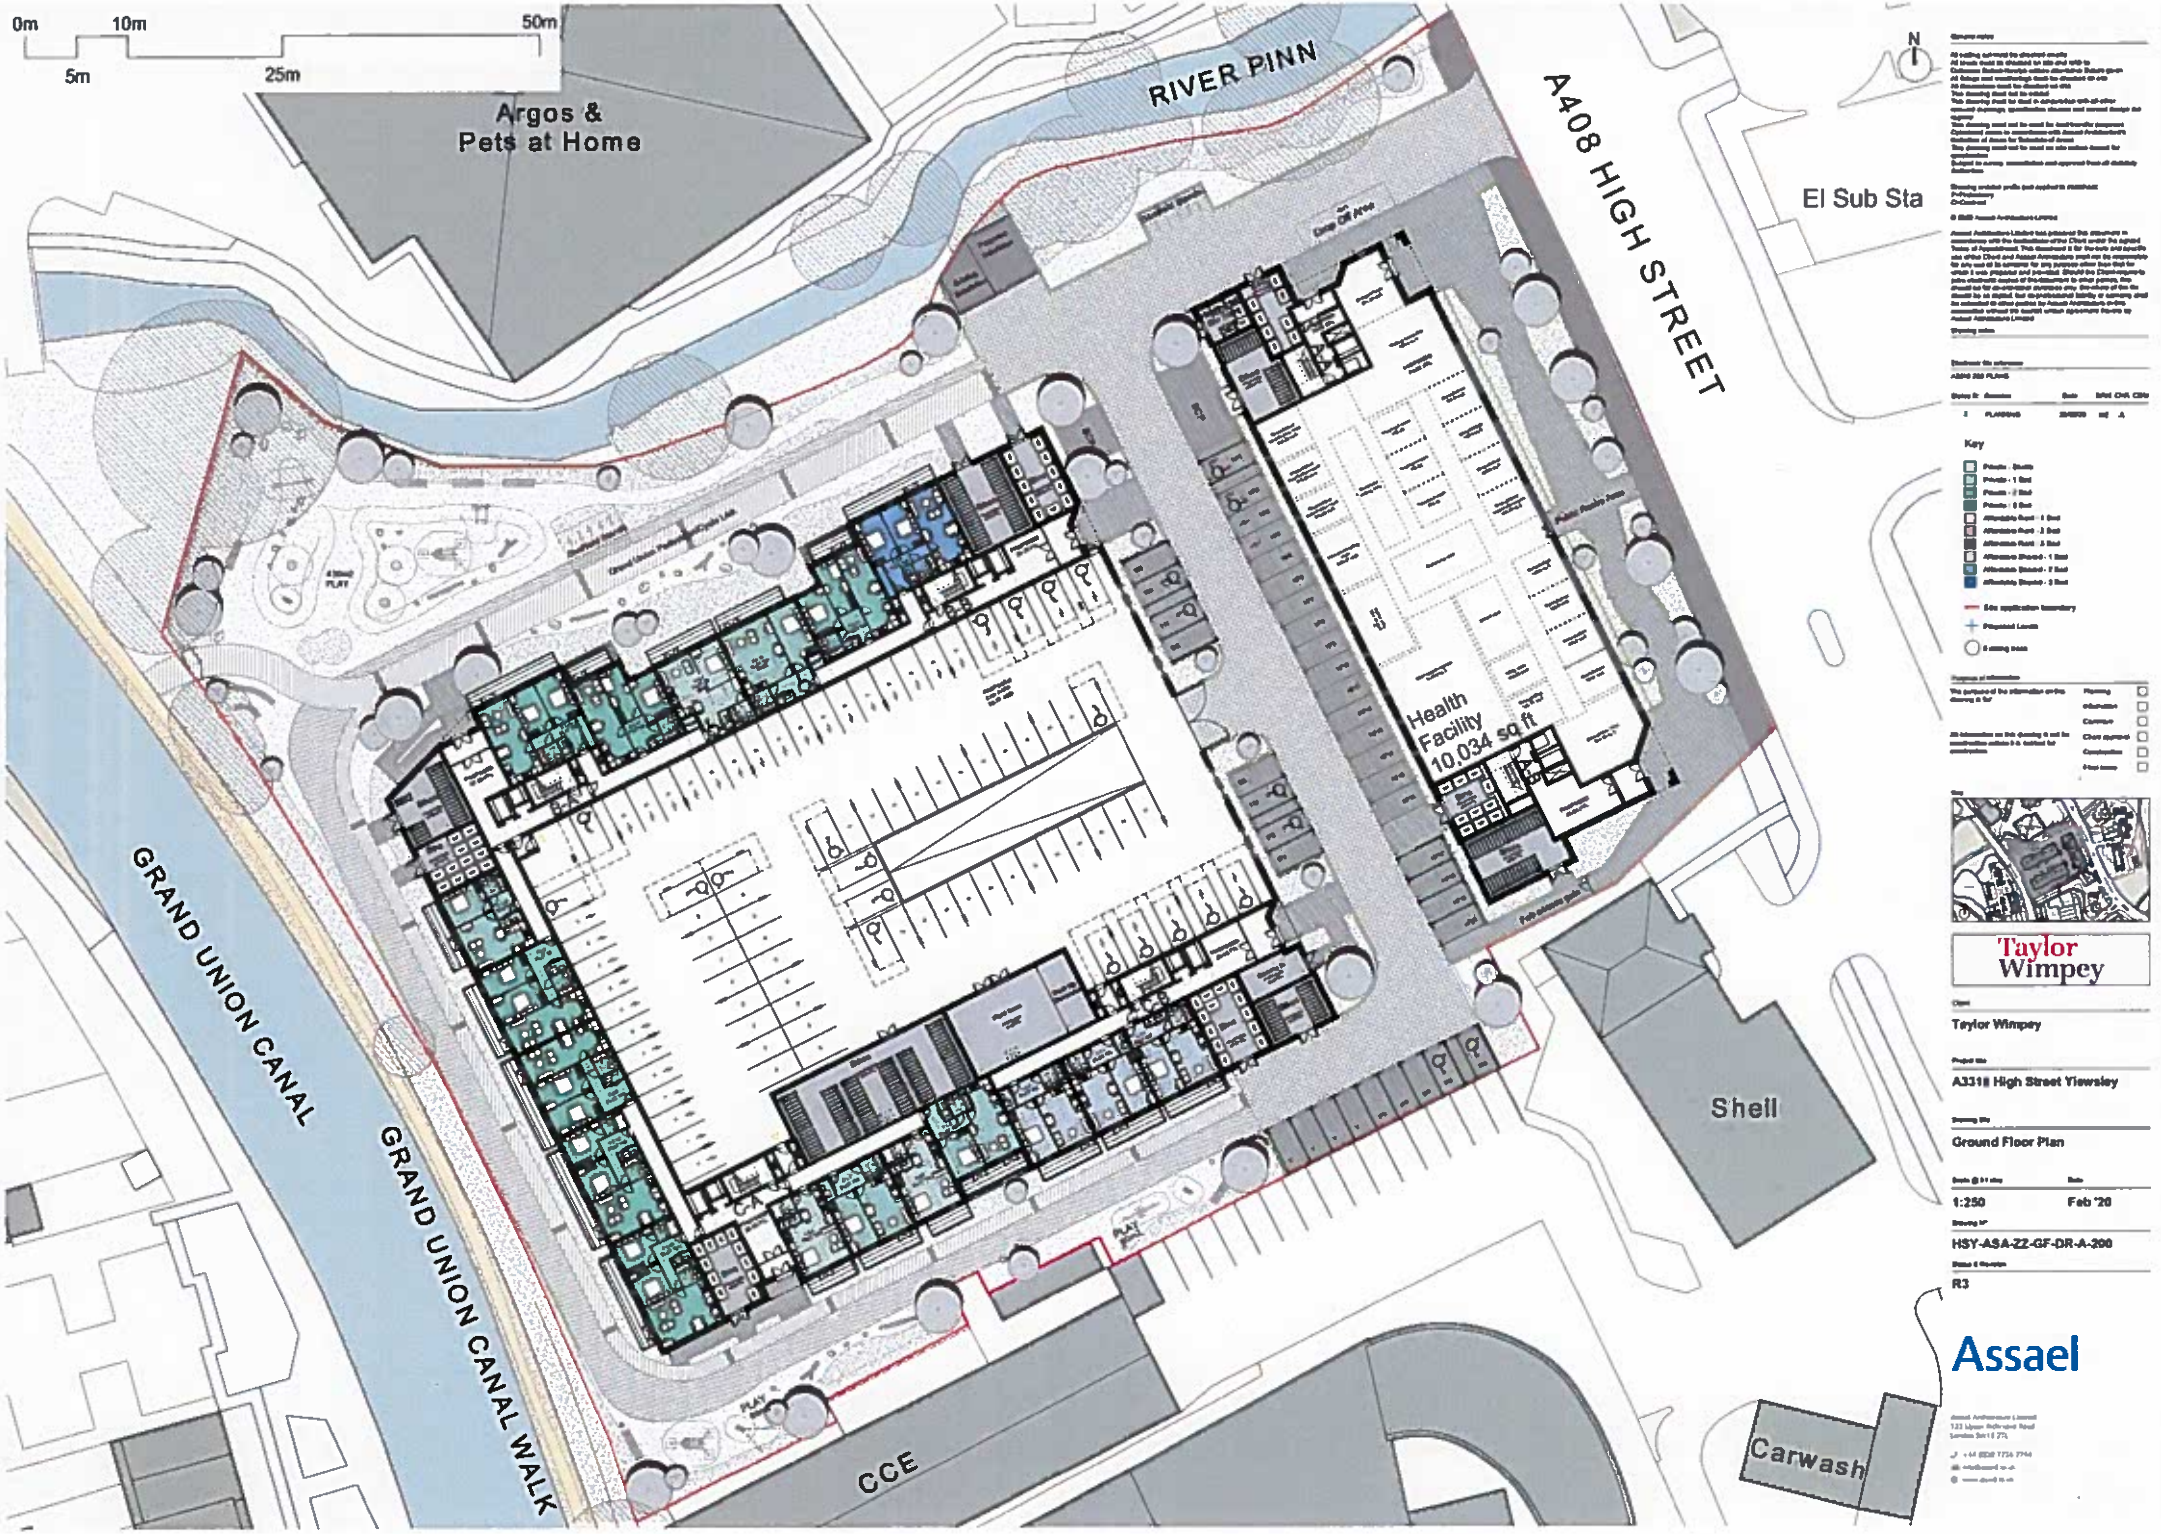

It is recommended that the actual site condition is ascertained through the completion of an intrusive Phase II ground investigation and completion of a Tier 2 Generic Quantitative Risk Assessment (GQRA).

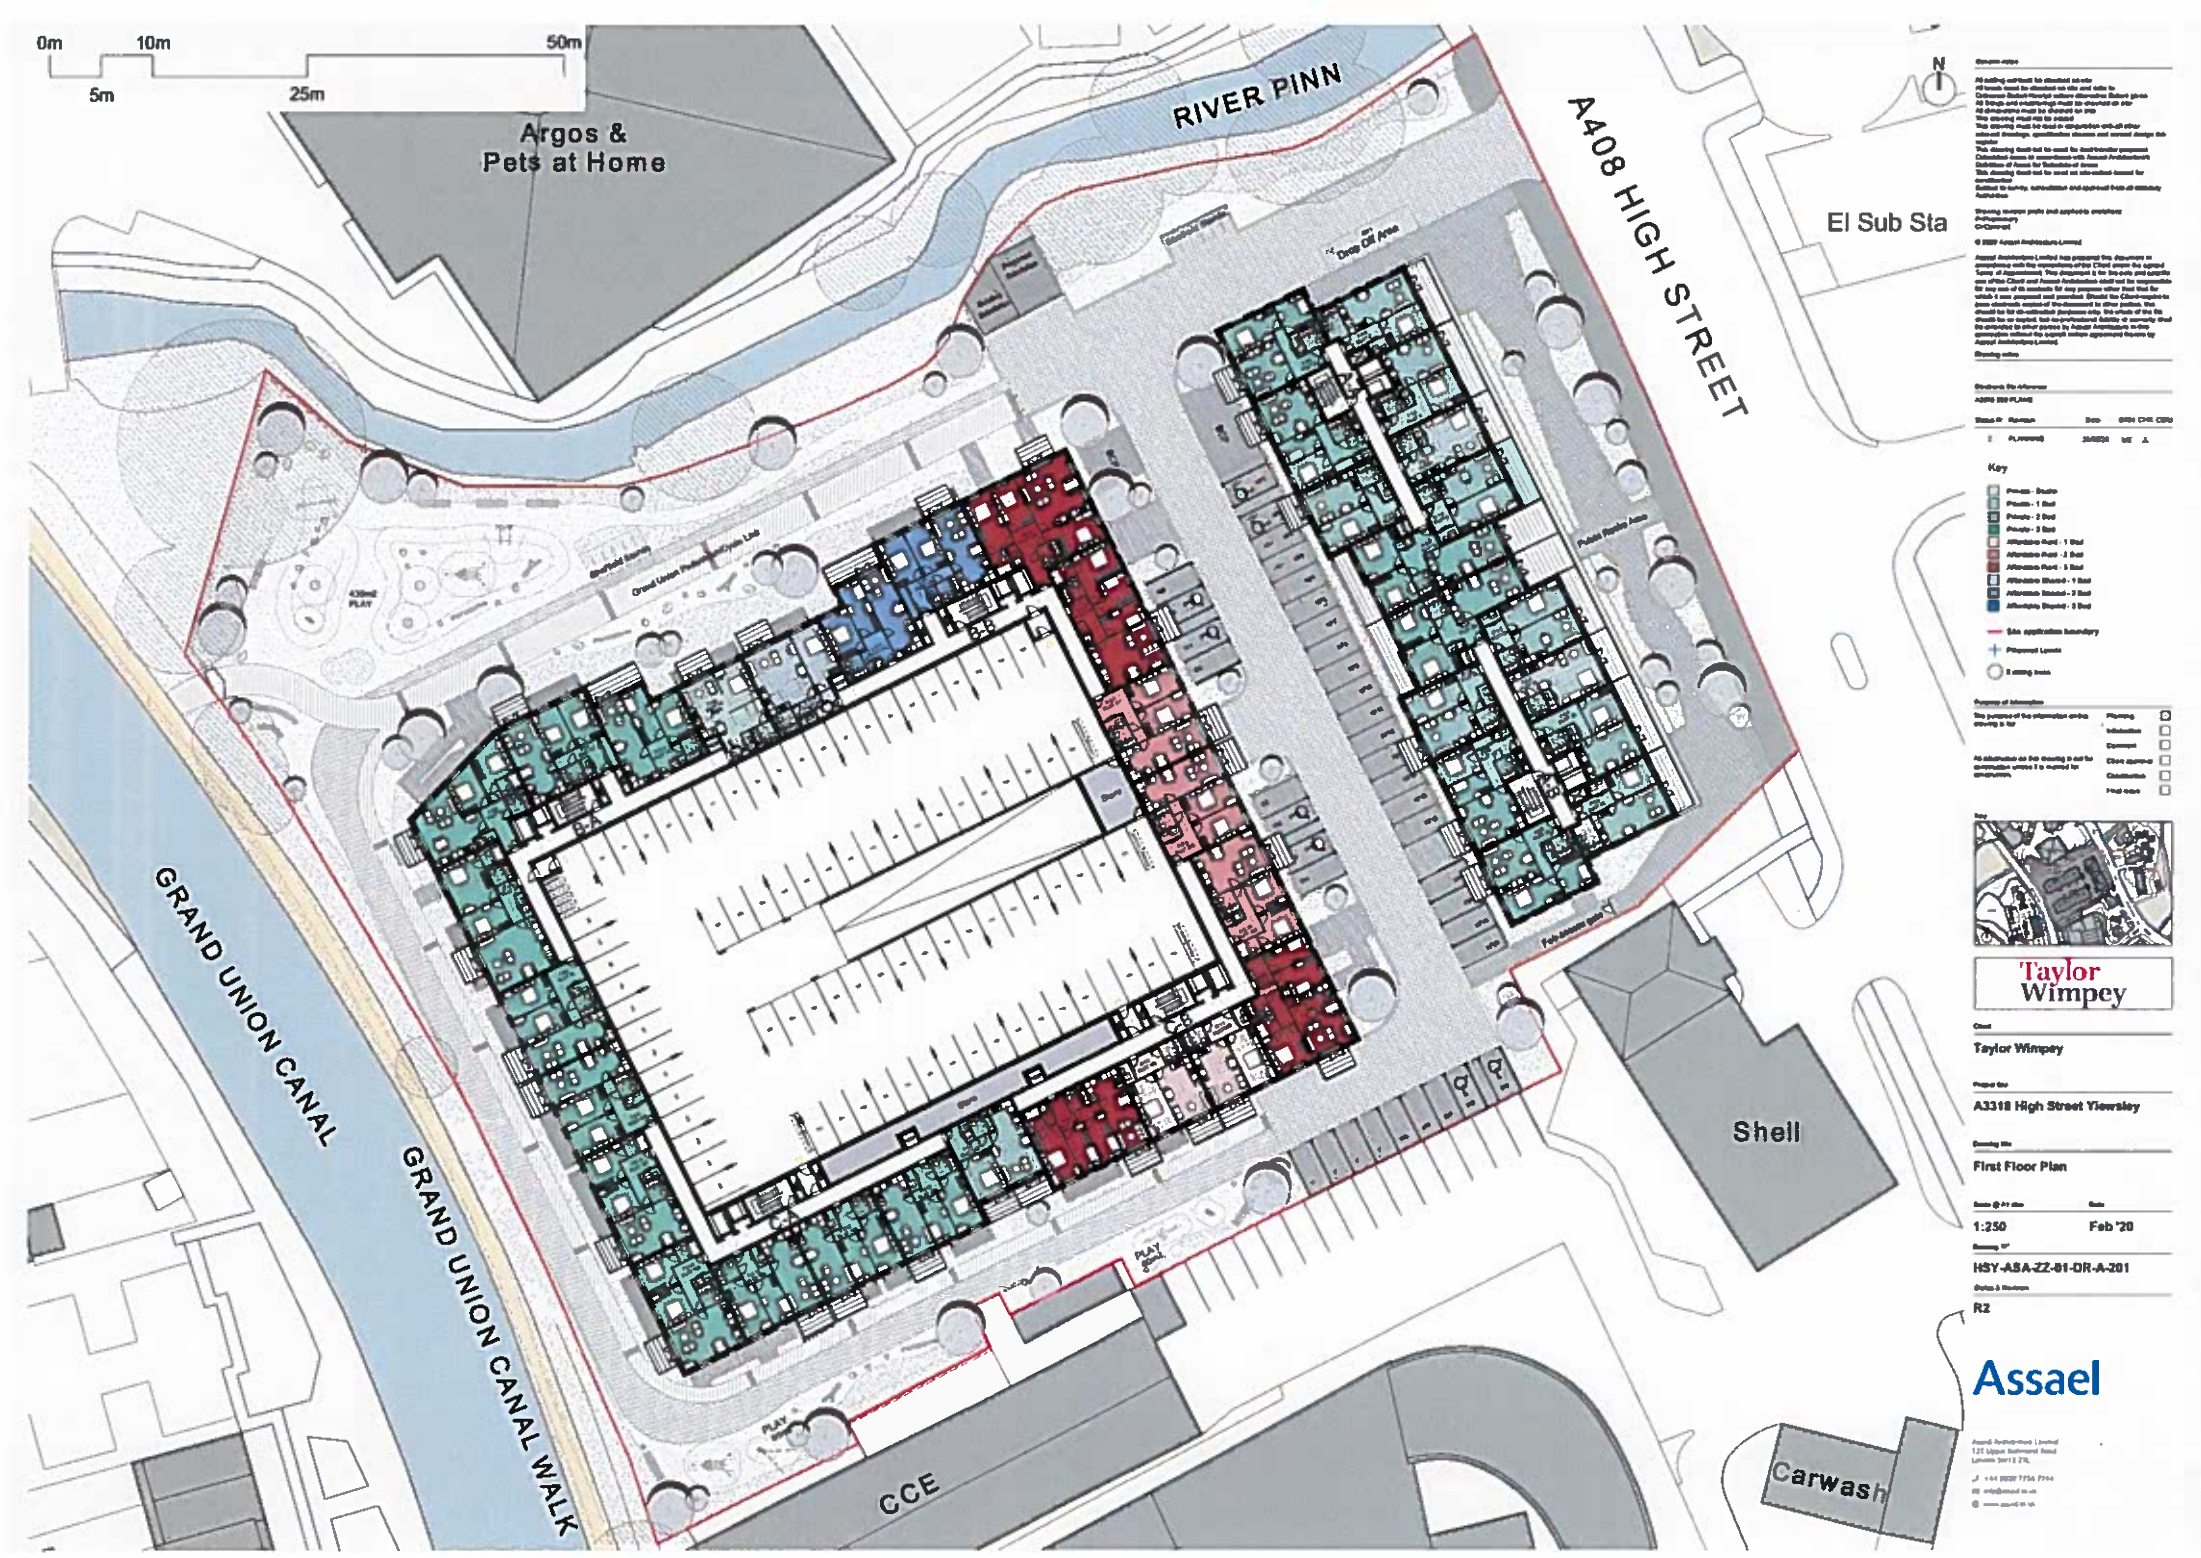

The Phase II ground investigation will seek to confirm the existence of the potential pollutant linkages identified within the preliminary CM and determine the need for, and extent of, further assessment or remediation/mitigation works necessary to reduce identified risks to an acceptable level and render the site suitable for its intended use.

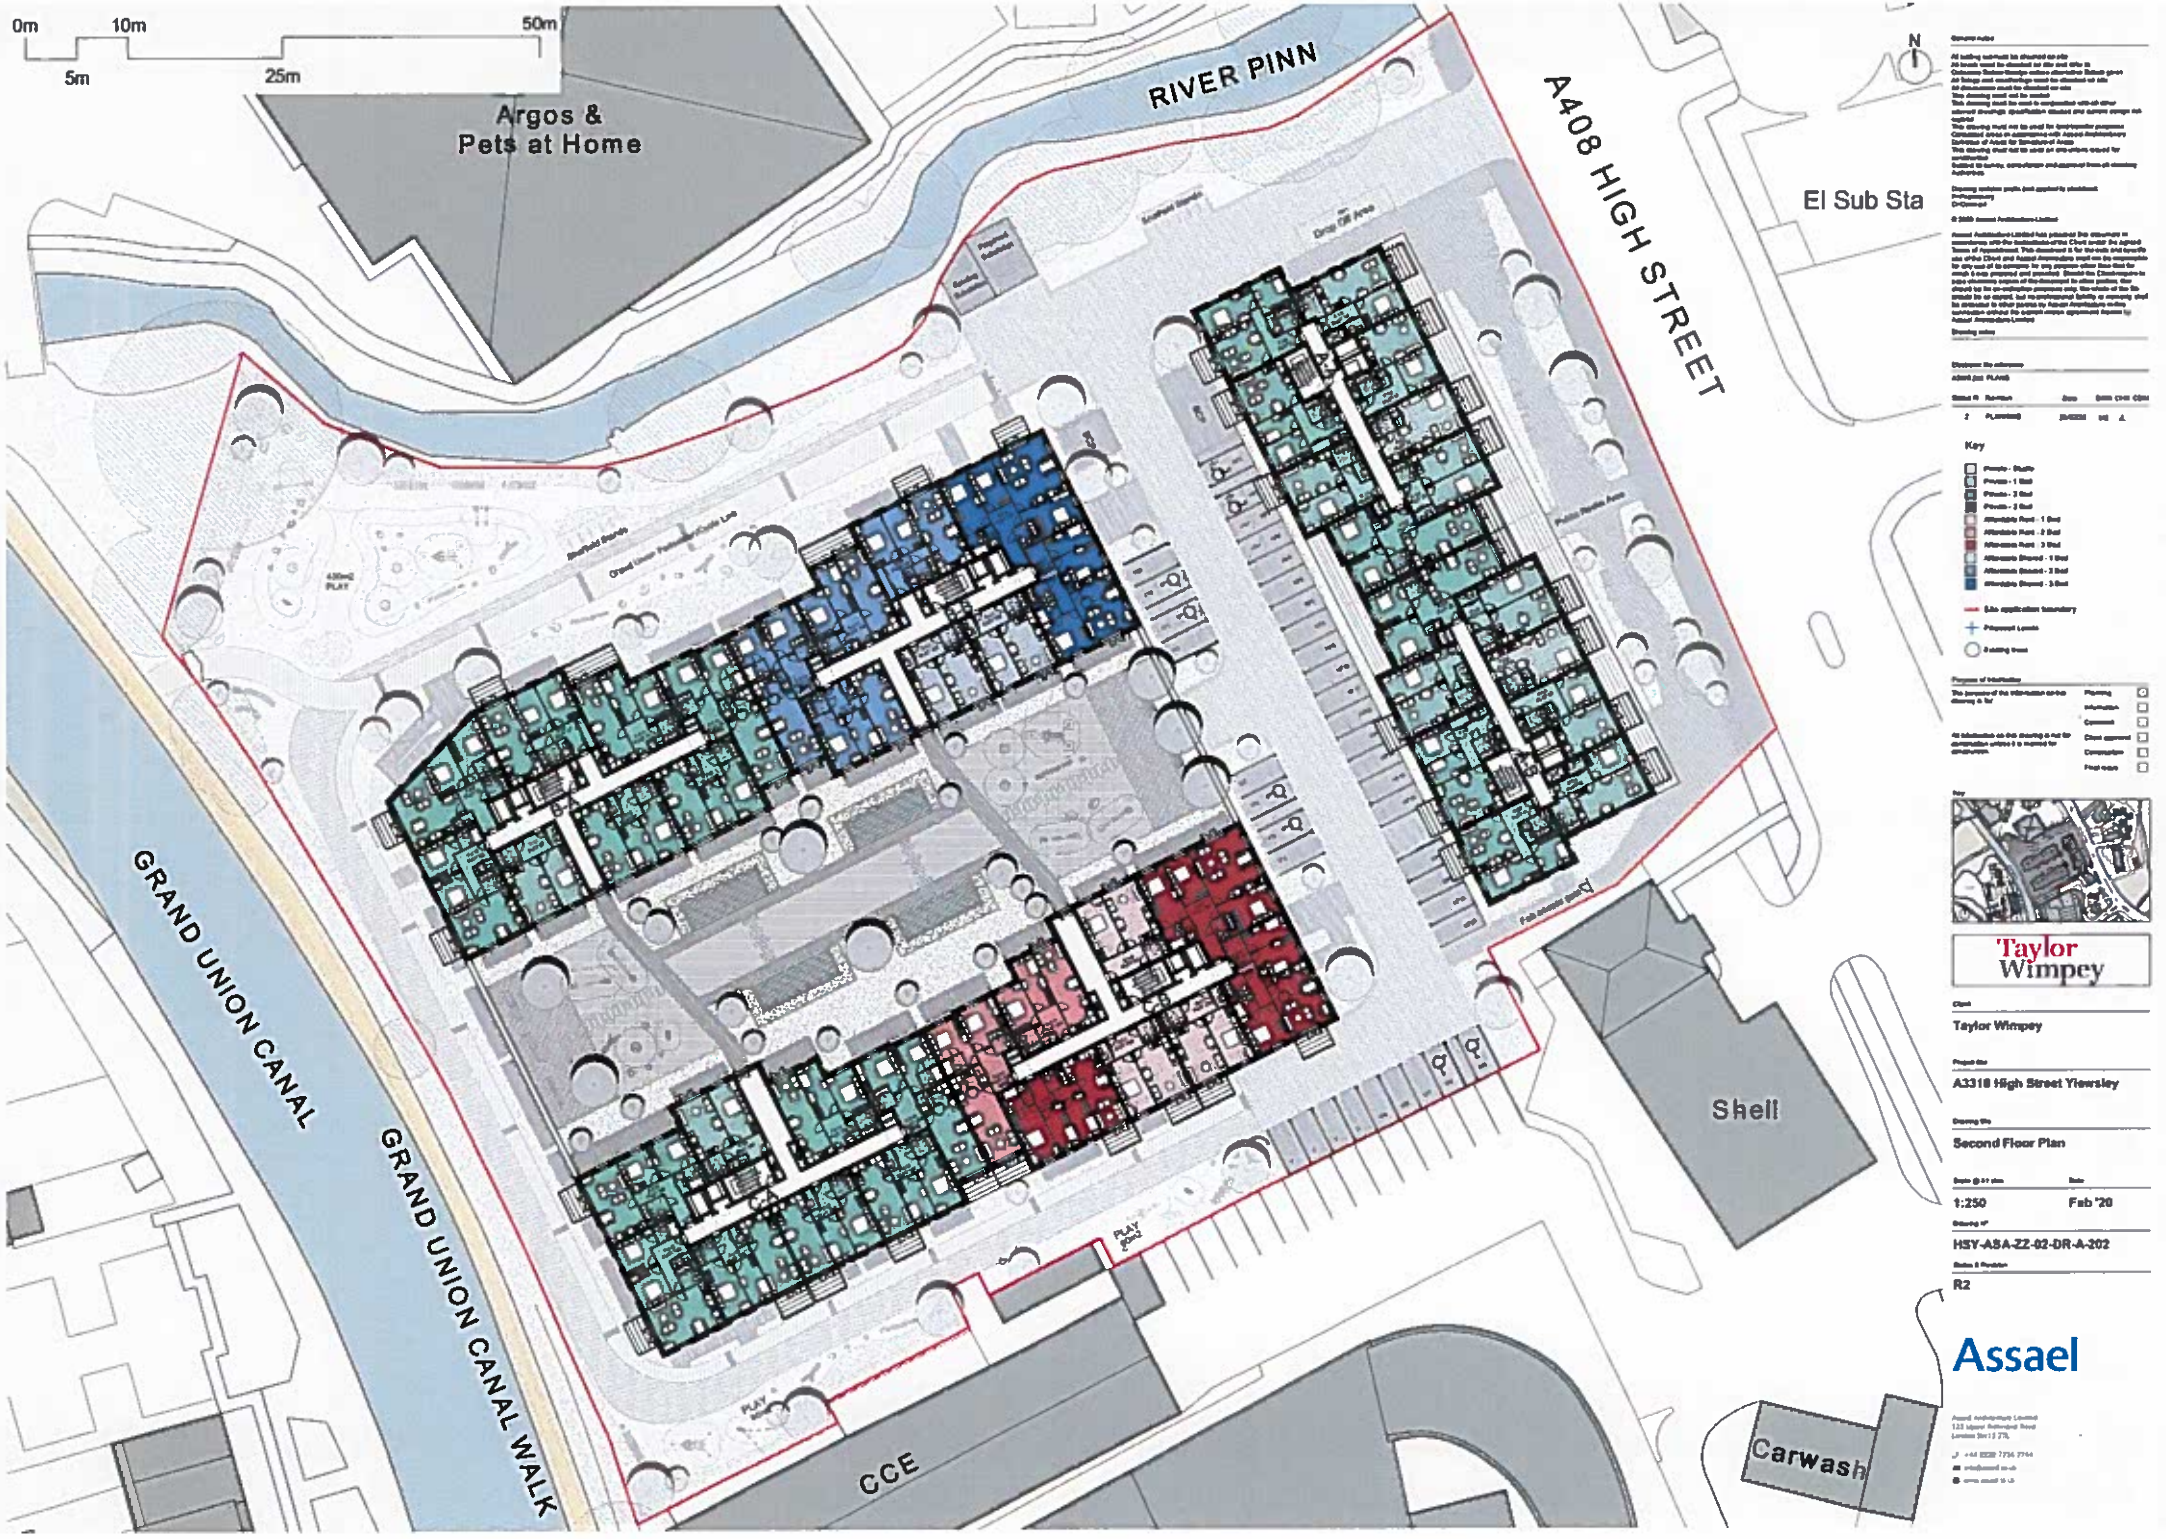

Given the age of the buildings on site present within the D&B Crash Repairs demise the potential for ACM to be present within the building fabric cannot be discounted. A Refurbishment/Demolition Asbestos Survey will be required prior to the proposed redevelopment of the site.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

CBRE

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Agency & Hydrological					
BGS Groundwater Flooding Susceptibility	pg 1	Yes	Yes	Yes	n/a
Contaminated Land Register Entries and Notices					
Discharge Consents	pg 1		4	6	11
Prosecutions Relating to Controlled Waters			n/a	n/a	n/a
Enforcement and Prohibition Notices					
Integrated Pollution Controls	pg 7			5	
Integrated Pollution Prevention And Control					
Local Authority Integrated Pollution Prevention And Control					
Local Authority Pollution Prevention and Controls	pg 7		5	4	6
Local Authority Pollution Prevention and Control Enforcements					
Nearest Surface Water Feature	pg 9		Yes		
Pollution Incidents to Controlled Waters	pg 10	1	9	5	21
Prosecutions Relating to Authorised Processes	pg 16				1
Registered Radioactive Substances					
River Quality	pg 16	1	4		1
River Quality Biology Sampling Points	pg 17		1		
River Quality Chemistry Sampling Points	pg 18				1
Substantiated Pollution Incident Register	pg 18			2	
Water Abstractions	pg 19	1			(*26)
Water Industry Act Referrals					
Groundwater Vulnerability Map	pg 25	Yes	n/a	n/a	n/a
Groundwater Vulnerability - Soluble Rock Risk			n/a	n/a	n/a
Groundwater Vulnerability - Local Information		1	n/a	n/a	n/a
Bedrock Aquifer Designations	pg 26	Yes	n/a	n/a	n/a
Superficial Aquifer Designations	pg 26	Yes	n/a	n/a	n/a
Source Protection Zones					
Extreme Flooding from Rivers or Sea without Defences	pg 26	Yes	Yes	n/a	n/a
Flooding from Rivers or Sea without Defences	pg 26	Yes		n/a	n/a
Areas Benefiting from Flood Defences				n/a	n/a
Flood Water Storage Areas				n/a	n/a
Flood Defences				n/a	n/a
OS Water Network Lines	pg 26		17	37	94

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Waste					
BGS Recorded Landfill Sites					
Historical Landfill Sites	pg 44		1	4	
Integrated Pollution Control Registered Waste Sites					
Licensed Waste Management Facilities (Landfill Boundaries)					
Licensed Waste Management Facilities (Locations)	pg 45			2	1
Local Authority Landfill Coverage		1	n/a	n/a	n/a
Local Authority Recorded Landfill Sites					
Potentially Infilled Land (Non-Water)	pg 45			3	6
Potentially Infilled Land (Water)	pg 46			3	10
Registered Landfill Sites					
Registered Waste Transfer Sites					
Registered Waste Treatment or Disposal Sites	pg 47			1	
Hazardous Substances					
Control of Major Accident Hazards Sites (COMAH)					
Explosive Sites					
Notification of Installations Handling Hazardous Substances (NIHHS)					
Planning Hazardous Substance Consents					
Planning Hazardous Substance Enforcements					

CBRE

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Geological					
BGS 1:625,000 Solid Geology	pg 48	Yes	n/a	n/a	n/a
BGS Estimated Soil Chemistry	pg 48	Yes	Yes	Yes	Yes
BGS Recorded Mineral Sites	pg 49		1	3	20
BGS Urban Soil Chemistry	pg 53		Yes	Yes	Yes
BGS Urban Soil Chemistry Averages	pg 57	Yes			
CBSCB Compensation District			n/a	n/a	n/a
Coal Mining Affected Areas			n/a	n/a	n/a
Mining Instability			n/a	n/a	n/a
Man-Made Mining Cavities					
Natural Cavities					
Non Coal Mining Areas of Great Britain				n/a	n/a
Potential for Collapsible Ground Stability Hazards	pg 57	Yes	Yes	n/a	n/a
Potential for Compressible Ground Stability Hazards	pg 57		Yes	n/a	n/a
Potential for Ground Dissolution Stability Hazards				n/a	n/a
Potential for Landslide Ground Stability Hazards	pg 58	Yes		n/a	n/a
Potential for Running Sand Ground Stability Hazards	pg 58	Yes	Yes	n/a	n/a
Potential for Shrinking or Swelling Clay Ground Stability Hazards	pg 58	Yes	Yes	n/a	n/a
Radon Potential - Radon Affected Areas			n/a	n/a	n/a
Radon Potential - Radon Protection Measures			n/a	n/a	n/a
Industrial Land Use					
Contemporary Trade Directory Entries	pg 59	3	30	102	126
Fuel Station Entries	pg 82		2		1
Points of Interest - Commercial Services	pg 82	3	11	39	35
Points of Interest - Education and Health					
Points of Interest - Manufacturing and Production	pg 89	2	16	26	29
Points of Interest - Public Infrastructure	pg 95		7	6	14
Points of Interest - Recreational and Environmental	pg 98		1	6	12
Gas Pipelines					
Underground Electrical Cables

Appendix C – Extract of Historical Maps

CBRE

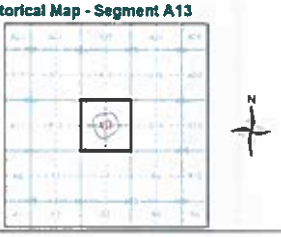

Middlesex
Published 1878 - 1885
Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1890 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1936, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Additional SIMs
Published 1963 - 1987
Source map scale - 1:1,250

The SIM cards (Ordnance Survey's "Survey of Information on Microfilm") are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land use. These maps were produced at both 1:2,500 and 1:1,250 scales.

In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1890 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1936, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1975

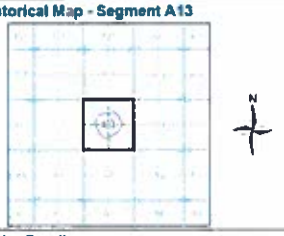

Source map scale - 1:1,250

OS 25 maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs
Published 1986 - 1989
Source map scale - 1:1,250

The SIM cards (Ordnance Survey's "Survey of Information on Microfilm") are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992

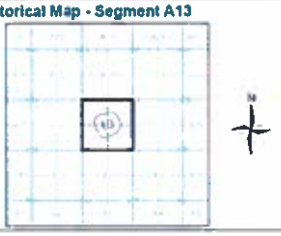

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1982, and continued to be produced until 1995. These maps were the first-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features, such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales

Appendix D – Risk Classification

Land Contamination

In line with current UK guidance, the land contamination / Phase I Environmental Assessment has been undertaken using a risk based approach, with the potential environmental risk assessed qualitatively using the 'source-pathway-receptor' scenario. In consideration of the information gathered an overall risk rating has been provided for the site based on the following definitions:

Low Risk

The site is considered suitable for proposed use and environmental setting. It is unlikely that any issues will arise as a significant issue in the context of any proposed redevelopment. Further work is not considered to be necessary.

Low to Medium Risk

Contaminants may be present but are unlikely to have an unacceptable impact on the identified receptors. The potential for some form of remediation or risk mitigation to be required in the context of any proposed redevelopment cannot be discounted. Further work is usually required to confirm the extent of the risk.

Medium Risk

Contaminants may be present and could have an unacceptable impact on the identified receptors. Some form of remediation or risk mitigation is likely to be required in the context of any proposed redevelopment. Further work is required to clarify the risk.

High Risk

Contaminants are probably or certainly present and are likely to have an unacceptable impact on the identified receptors. Remediation or risk mitigation is very likely to be required in the context of any proposed redevelopment. It is possible that the site may not be suitable for its proposed end use. Further work is required to clarify the risk.

Appendix E – Glossary

Principal Aquifers - These are layers of rock or drift deposits that have high intergranular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale. In most cases, principal aquifers are aquifers previously designated as major aquifer.

Secondary A Aquifers – These are permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers;

Secondary B Aquifers – These are predominantly lower permeability layers which may store and yield limited amounts of groundwater due to localised features such as fissures, thin permeable horizons and weathering. These are generally the water-bearing parts of the former non-aquifers.

Secondary Undifferentiated Aquifers – This has been assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.

Unproductive Strata – These are rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

Inner zone (Zone 1) - Defined as the 50-day travel time from any point below the water table to the source. This zone has a minimum radius of 50m.

Outer zone (Zone 2) - Defined by a 400-day travel time from a point below the water table. This zone has a minimum radius of 250 or 500m around the source, depending on the size of the abstraction.

Total catchment (Zone 3) - Defined as the area around a source within which all groundwater recharge is presumed to be discharged at the source. In confined aquifers, the source catchment may be displaced some distance from the source. For heavily exploited aquifers, the final Source Catchment Protection Zone can be defined as the whole aquifer recharge area where the ratio of groundwater abstraction to aquifer recharge (average recharge multiplied by outcrop area) is >0.75.

Appendix F – Report Qualifications

1. This report (the "Report") has been prepared by CBRE Limited ("CBRE") exclusively for Taylor Wimpey West London Ltd (the "Client") in accordance with the terms of the proposal dated 19 February 2020 ("the Instruction"). The Report is confidential and must not be disclosed to any person other than the Client without CBRE's prior written consent. CBRE has provided this report on the understanding that it will only be seen and used by the Client and no other person is entitled to rely upon it, unless CBRE has expressly agreed in writing. Where CBRE has expressly agreed that a person other than the Client can rely upon the report then CBRE shall have no greater liability to any party relying on this report than it would have had if such party had been named as a joint client under the Instruction.
2. CBRE's maximum aggregate liability to all parties, howsoever arising under, in connection with or pursuant to the Report, and whether in contract, tort, negligence or otherwise shall not exceed £5M.
3. CBRE shall not be liable for any indirect, special or consequential loss or damage howsoever caused, whether in contract, tort, negligence or otherwise, arising from or in connection with this Report. Nothing in this Report shall exclude liability which cannot be excluded by law.
4. This report was prepared for the sole use of the named Client, as defined above, and shall not be relied upon or transferred to any other party without the express written authorisation of CBRE. The report may contain material subject to copyright or obtained subject to license; unauthorised copying of this report will be in breach of copyright/license.
5. It is noted that flood risk is driven by natural processes and methods used to assess risk are based on estimates of flood likelihood and consequences. The findings and opinions provided in this report are given in good faith and are subject to the limitations imposed by employing site assessment methods and techniques, appropriate to the time of investigation and within the limitations and constraints defined within this document. The findings and opinions are relevant to the dates when the assessment was undertaken, but should not necessarily be relied upon to represent conditions at a substantially later date.
6. The findings and opinions conveyed, via this report, are based on information obtained from a variety of sources as detailed in this report. The information reviewed should not be considered as exhaustive and has been accepted in good faith as providing true and representative data pertaining to the site conditions. Therefore, CBRE cannot and does not guarantee the authenticity or reliability of the third-party information it has relied upon. CBRE reserve the right to alter the conclusions and recommendations presented in this report in the light of further information that may become available.
7. Where opinions expressed in this report are based on current available guidelines and legislation, no liability can be accepted by CBRE for the effects of any future changes to such guidelines and legislation. In the event that legislation changes it may be necessary for CBRE to update/modify this report in line with new guidance.
8. Where no/limited site inspections are undertaken (for example due to limited site access) CBRE cannot comment on the potential for environmental concerns associated with the current use or structure including the presence of Asbestos and Invasive Species. It should also be noted that any risks identified in this report are perceived risks based on the information reviewed; actual risks can only be assessed following a physical investigation of the site.

9. We have not undertaken a specific Asbestos survey of the site and do not give advice on asbestos related matters, but we have included recommendations within the text of this report with regard to the need for specialist inspections and testing as appropriate.
10. At the time of our inspection, the site was in use and for reasons of safety we were unable to raise the drainage access covers. We have not therefore undertaken any inspection of the below ground drainage services and cannot comment on the condition thereof.
11. The limitations of liability of CBRE for the contents of this report have been agreed with the Client, as set out in the terms and conditions of instruction.
