1. Introduction

1.1 Objectives

Cube/Earth Water GCE has been instructed by Three Sixty Design Solutions to undertake a Phase 1 Preliminary Contamination Risk Assessment Report (PRA) of the subject site, referred to as Colnbrook Immigration Removal Centre Car Park, located to the north of Colnbrook By-Pass, in Harmondsworth, West Drayton. The postcode for the site is UB7 0HB and the site lies in Greater London. The overall objective of the Preliminary Contamination Risk Assessment, also known as a Desk Study Report, was to inform the Client of the ground conditions and any potential environmental or ground-related risks associated with proposed redevelopment works on site.

The risk assessment undertaken relates to the proposed scheme which will include minor extensions and rationalisation of the existing car park. This will involve extensions to existing tarmac areas and infilling of circulation islands to provide additional car parking spaces. All the proposed works remain within previously developed and well-screened areas. Full details on the proposed works are summarised in Section 1.3 of this report. This Phase 1 Preliminary Contamination Risk Assessment Report will support a forthcoming planning application for the site.

An Envirocheck Environmental Insight Report (report reference: 401452705_1_1 dated 30th April 2026) has been used to support the findings of this Preliminary Contamination Risk Assessment.

1.2 Site Location and Description

The site is narrow and irregular in shape and comprises an area of approximately 1.01 hectares as shown in

Figure 1. The site lies directly to the north of Colnbrook By-Pass (the A4 road) and directly to the west of the Colnbrook Immigration Removal Centre complex. The site is directly east of Duke of Northumberland´s River and Waterside British Airways International Headquarters Facility. The campus-style Waterside facility has a unique, village-like design featuring six, four-story sections connected by a glass-roofed internal street with shops and cafes.

The site lies within Harmondsworth within the London Borough of Hillingdon. The site is located from approximately 500m to the north of London Heathrow Airport in Greater London. The centre of the site is located at the approximate National Grid Reference 505310, 177270. The site is generally flat and level and lies at an approximate elevation of 25.5m AOD.

The area directly to the east of the site has a long-standing history of government and institutional use dating back to the mid-20th Century, with successive phases of development accommodating administrative, operational and security-related functions. The Colnbrook Immigration Removal Centre, which opened in 2004, is an immigration detention facility that holds foreign nationals without permission to be in the UK prior to their deportation. The site is characterised by modern buildings, hardstanding, access roads and associated infrastructure typical of a secure operational facility.

Figure 1: Site Location Plan

Taken from Environmental Insight Report OS Mapping Records

The site lies in a developed area, dominated by industrial and commercial operations including hotels, offices, logistics and parking associated with London Heathrow Airport. Some residential properties and areas of undeveloped land and recreational grounds are present within the wider area.

The site comprises a busy car park, providing parking for staff and visitors to the Colnbrook Immigration Removal Centre, which can be directly accessed via the south-eastern part of the car park on site. Security access into the car park is present and a permitting procedure is in place. The car park is congested and busy, with unacceptable parking practices taking place. This includes parking outside of designated bays, along verges and in adjoining areas of the site. Due to the narrow nature of the site this has become impractical and major upgrades to the parking provisions are required. Soft landscaping is present along the western site boundary and in sporadic areas throughout the site between the parking bays, though no recreational areas are present.

Further details on the site layout and operations are provided in Section 1.4 of this report.

Figure 2: Existing Site Layout

Taken from the Design & Access Statement for the site (produced by Three Sixty Design Solutions, dated January 2025)

1.3 Proposed Development

The proposed redevelopment scheme at the site involves the minor extension and rationalisation of the existing car park. This will involve extensions to existing tarmac areas and infilling of circulation islands to provide additional car parking spaces. The limited existing peripheral soft landscaped areas will remain on site as part of the scheme. The proposed site configuration is presented in Appendix A. These options were outlined in the Design & Access Statement for the site (produced by Three Sixty Design Solutions, dated January 2025).

The extensions to the existing car park arise from an acute operational need to increase capacity, with demand now exceeding the available provision daily. Expanding the current facility represents the only viable option to accommodate this pressure. The proposals therefore constitute a necessary and pragmatic intervention designed to support the ongoing functionality of the wider Colnbrook Immigration Removal Centre.

1.4 Site Walkover Survey

A site walkover survey was conducted on the 24th April 2026 by Ali Raza of Earth Water GCE. A series of photographs taken during the walkovers are presented in Appendix B.

The site is accessible via a security-controlled gate towards the south of the site, accessed from Colnbrook By-Pass, where access to the main Colnbrook Immigration Removal Centre is also available.

The existing car park on site was noted to be long and narrow and very congested, with cars parked in all areas of available space within the site. This included several vehicles parked along kerbs and within any area of free space, outside of the official parking spaces on both hardstanding and soft landscaping.

There are several large, mature and dense trees which line the west side of the site between the car park

and Duke of Northumberland's River. Some weeds and scrub vegetation were noted adjacent to the car parking spaces and areas of grass landscaping were present throughout the existing car park. The external hardstanding areas on site were generally in good condition and comprised concrete surfacing.

No visual or olfactory evidence of contamination was observed on site. Two shipping containers (which appeared to be used for storage purposes) were present on site, with some waste materials stored adjacent to the containers. This included plastic and wooden furniture and office items, alongside some landscaping equipment. No evidence of fly tipped waste was observed on site during the site walkover. No evidence of leaks or spills were observed during the site walkover.

No evidence of present or historic above or below-ground fuel storage tanks were observed on site. An electrical sub-station was present off-site within the Colnbrook Immigration Removal Centre, located approximately 30m to the east of the site boundary.

No standing water was noted on site during the site walkover. Various manhole covers and drains were observed on site.

There were no signs of any subsidence in the existing property during the site walkover, and the site was not thought to be within the exclusion zone of any tunnels or railway lines.

1.5 Limitations

This report is based upon information obtained from third party sources, together with observations from the site walkover. The third-party data has been accepted at face value and has not been independently verified. Earth Water GCE can therefore give no warranty, representation, or assurance as to the accuracy or completeness of such information.

This report has been prepared for the sole internal use and reliance of the Client, Three Sixty Design Solutions and shall not be relied upon by other parties without the express written authority of Earth Water GCE. If an unauthorised third party comes into possession of this report, then they rely on it at their own risk.

2. Site and Surrounding Area Historical Mapping Review

Detailed maps and aerial photographs of the site and surrounding area dated 1868 to 2026 (at scales of 1:1,250, 1:2,500, 1:10,000 and 1:10,560), provided by Envirocheck for the site, have been reviewed. This has been undertaken to identify any former land uses at the site and within the surrounding area that may have geotechnical or geo-environmental implications for the proposed development. The findings are summarised in Table 1. Google Earth and other sources of publicly available information have also been reviewed to support this assessment.

Table 1: History of the Site and Surrounding Area

Map date and scale	Key on-site features	Key off-site features
1868	By 1868, the site comprised undeveloped land and was partially covered in woodland.	The area surrounding the site was occupied by undeveloped land, woodland and sporadic farms and residential properties over 150m from the site boundary.
1889 to 1900 (1:2,500 and 1:10,560)	No changes were noted on site.	Duke of Northumberland´s River was labelled directly west of the site boundary. By 1896, a public house was labelled approximately 175m south of the site.
1914 to 1920 (1:2,500 and 1:10,560)	No changes were noted on site.	By 1914, wider residential properties had been constructed from over approximately 225m from the site boundary.
1935 to 1948 (1:2,500 and 1:10,560)	By 1935, the site formed part of a recreation ground, which extended off site to the east. No buildings or structures were shown on site.	By 1935, Road Research Laboratory (Department of Scientific Industrial Research) and associated residential properties had been constructed directly east of the site, with various structures present within the facility. Colnbrook By-Pass was labelled directly south of the site. A school was labelled approximately 250m north-east of the site and wider residential development was noted to have occurred. By 1946, London Airport (later to be renamed as London Heathrow Airport) was present approximately 500m south of the site.
1960 to 1966 (1:1,250, 1:2,500 and 1:10,000)	By 1960, the site was no longer part of the recreation ground and contained a walkway running parallel to the Duke of Northumberland River. Three small unlabelled buildings, which appeared to be used for storage purposes were present on site.	By the early-1960s, significant expansion of the facility directly east of the site had taken place, with numerous new buildings having been constructed and it was labelled as a works. A series of unlabelled buildings, some of which appeared to be offices were present. Wider residential expansion over 250m from the site boundary had taken place. The public house to the south was no longer shown by 1966. By 1965, the M4 motorway was labelled approximately 1km to the north of the site.
1970 to 1976 (1:1,250, 1:2,500 and 1:10,000)	No changes were noted on site.	By 1971, the entire area to the east of the site had undergone further development and were labelled as government buildings. Tanks associated with these buildings were labelled approximately 150m east of the site. A large computer centre was labelled directly east of the site, and an electricity sub-station was labelled approximately 50m east associated with the centre. An additional electricity sub-station was present around 100m east. Sheraton Hotel, which included swimming pools, was labelled from 200m east and an associated electricity sub-station was present around 200m east of the site.

Map date and scale	Key on-site features	Key off-site features
		By 1970, a series of gravel pits were present to the south-west, west and north-west of the site, from approximately 350m to 1km from the site boundary.
1981 to 1989 (1:2,500 and 1:10,000)	No changes were noted on site.	By 1981, a squash club and further residential properties had been constructed over 150m from the site boundary. Wider commercial and industrial development had taken place within the nearby area, predominantly associated with London Heathrow Airport. By 1989, the gravel pits within the wider area around the site were no longer shown, indicating that they had possibly been infilled.
1992 to 1999 (1:1,250, 1:2,500 and 1:10,000)	A 1999 aerial photograph of the site showed a vegetated walkway running parallel to the Duke of Northumberland River.	By 1998, a large office complex, operated by British Airways known as the Waterside British Airways International Headquarters Facility had been constructed from approximately 100m west of the site (this reportedly involved some remedial action following the use of the site as gravel pits with subsequent landfilling and land raising). Wider residential, commercial and industrial expansion was noted to have taken place within the wider area around the site.
2006 to 2026 (1:10,000)	By 2006, the site appeared to be in use as a car park for the adjacent Colnbrook Immigration Removal Centre. The site remained in use at the time of writing in 2026.	Wider commercial and industrial expansion was noted to have taken place within the nearby area around the site.

3. Environmental Desk Study Assessment

3.1 Geology

Information on the underlying geology at the site has been obtained from the British Geological Survey (BGS) Sheet 269 for Windsor and Bracknell (scale: 1:50,000 dated 1999), the BGS Geological Map Viewer and Geological Mapping provided by Landmark within the Envirocheck Report (a copy of which is provided in Appendix C).

Worked or Artificial Ground has not been identified on site by Envirocheck or the BGS, though is shown to lie directly west of Duke of Northumberland´s River to the west and north-west of the site and extend over 500m from the site boundary. This area of Worked Ground is extensive and appears to relate to former gravel pits, associated workings and potential landfilling and land raising that took place prior to the mid-1990s. The area from 100m west of the site, extending over 500m to the west and north-west of the site. This relates to the Waterside British Airways International Headquarters Facility. Historically this area comprised open land adjacent to the Duke of Northumberland´s River, crossed by a series of land drains. Various further areas of Made Ground or Worked Ground are recorded over 250m from the site boundary associated with further gravel pits.

A covering of Made Ground is anticipated to be present beneath areas of widespread hardstanding on site, comprising both car parking spaces and the access road. According to mapping records, no historical demolition has been carried out on site since mapping records began in the 1860s.

There are no areas of potentially infilled land (non-water) recorded by Envirocheck within 275m of the site. One area relating to unknown filled ground (i.e. a pit of quarry) is recorded approximately 292m to the south-east of the site, shown on historical mapping for the surrounding area dated 1989. No further areas of potentially infilled land (non-water) are recorded within a 725m radius of the site.

There are three areas of potentially infilled land (water) between 245m and 260m from the site boundary, dating to 1934 to 1960 and appear to relate to small ponds.

Superficial Deposits comprising the Taplow Gravel Member are recorded to underlie the site and the immediate surrounding area. The stratum typically comprises sand and gravel, with local lenses of silt, clay or peat. This stratum was formed approximately 126,000 to 362,000 years ago during the Quaternary period. The Taplow Gravel Member is typically 5m thick but can extend to 9m thick locally in this area of Waltham Abbey. The stratum is locally underlain by the London Clay Formation bedrock.

Alluvium Superficial Deposits appear to overlie the Taplow Gravel Member, particularly within the northern portion of the site, encroaching across the western site boundary associated with Duke of Northumberland´s River. The Alluvium typically comprises soft to firm, unconsolidated compressible clay, silt, sand, peat and basal gravel. These deposits were formed during the Quaternary period.

The Taplow Gravel Member is shown on BGS mapping to be directly underlain by the London Clay Formation bedrock below the site. This stratum comprises bioturbated or poorly laminated, blue-grey, or grey-brown, silty to very silty clay. Clayey silt and sandy clay are occasionally recorded, and it commonly contains thin courses of carbonate concretions (known as cementstone nodules) and disseminated pyrite. The London Clay Formation can be up to 100m thick in the eastern area of the London Basin. The stratum was formed between 47 and 56 million years ago during the Paleogene period. The London Clay Formation is underlain by the Lambeth Group bedrock at depth below the site and the surrounding area according to BGS records.

The closest BGS borehole log to the site was recorded by the BGS approximately 25m to the east of the site within Colnbrook Immigration Removal Centre (which was previously known as Harmondsworth Immigration Detention Centre at the time of excavation) and related to a trial pit advanced in in February

1991 (borehole reference: TQ05307720). This trial pit was advanced to a depth of 2.8m bgl. The borehole encountered dark brown, gravelly Clay with numerous fine rootlets to 0.15m bgl, underlain by loose, white, slightly sandy, fine Gravel to 0.2m bgl. This shallow material was representative of Made Ground. Between 0.2m and 1m bgl, firm, orange-brown, silty Clay with occasional fine gravely and rare, medium to coarse gravel was recorded. Between 1m and 2m bgl, soft, becoming firm, light brown, friable, very clayey Silt was recorded. This appeared to possibly be representative of the Alluvium. Between 2m and 2.8m bgl at the base of trial pit, medium dense to dense, orange-brown, clayey, sandy, sub-angular to rounded flint Gravel was recorded. This was representative of the Taplow Gravel Member. Some groundwater seepage was recorded at 2.7m bgl and the sides of the trial pit were noted to be collapsing. A copy of this BGS borehole log is provided in Appendix E.

There are no contaminated land register entries and notices recorded within 1km of the site.

3.2 Mining and Mineral Extraction

The site is not located within an area with a history of coal mining and no mining records are listed within 1km of the site according to Envirocheck records.

The closest BGS recorded mineral site is recorded approximately 146m to the north-west of the site boundary and relates to Harmondsworth Moor Gravel Pit. This was an opencast working, extracting sand and gravel from the Shepperton Gravel Member and all operations are recorded to have ceased. A further fourteen BGS recorded mineral sites are recorded by Envirocheck between 350m and 1km from the site boundary. These entries relate to opencast gravel pits, extracting sand and gravel from the Shepperton Gravel Member and the Taplow Gravel Member and all operations are recorded to have ceased.

No natural cavities or man-made cavities are recorded within a 1km radius of the site boundary by Envirocheck.

3.3 Soil Chemistry

Estimated BGS soil chemistry data based on characteristics of the natural geochemistry of the geological units present at the site has been provided within the Envirocheck Report. A review of this data has been undertaken and is summarised in Table 2.

Site-specific empirical data, referred to by the BGS as ‘Measured Urban Soil Chemistry’ has been recorded for a location approximately 25m to the west of the site boundary and has been included in Table 2.

Table 2: Soil Chemistry Summary

Contaminants	Average concentrations and Site Specific Imperial Data (mg/kg)
Arsenic	15 to 25 mg/kg (21.4 mg/kg located approximately 25m west of the site)
Cadmium	<1.8 to >3 mg/kg (8.5 mg/kg located approximately 25m west of the site)
Chromium	120 to 180 mg/kg (144.50 mg/kg located approximately 25m west of the site)
Lead	<150 mg/kg (123.60 mg/kg located approximately 25m west of the site)
Nickel	45 to 60 mg/kg (61.90 mg/kg located approximately 25m west of the site)

The estimated soil chemistry for Arsenic, Cadmium, Chromium (assuming trivalent), Lead and Nickel do not exceed the relevant Generic Assessment Criteria (GACs) for commercial / industrial land use, which

include Soil Guidance Values (SGVs) (CL:aire), Category 4 Screening Levels (C4SLs) (DEFRA) and the 2014 Land Quality Management (LQM) / Chartered Institute of Environmental Health (CIEH) Suitable for Use Levels for Human Health Risk Assessment (S4ULs).

3.4 Hydrogeology

The Alluvium superficial deposits are classified as a Secondary A Aquifer by the Environment Agency. The Lambeth Group bedrock is also classified as a Secondary A Aquifer. Secondary A Aquifers comprise permeable layers that can support local water supplies and may form an important source of base flow to rivers.

The Taplow Gravel Member is classified as a Principal Aquifer, described as a highly permeable, strategically important rock layer or deposit that provides significant quantities of drinking water, supports industrial needs, and maintains base flows to rivers and wetlands. They typically have high intergranular or fracture permeability and are considered critical to water supply.

The London Clay Formation bedrock is classified as Unproductive Strata by the Environment Agency. Unproductive strata are largely unable to provide usable water supplies and are unlikely to have surface water and wetland ecosystems dependent on them.

The site does not lie within a groundwater Source Protection Zone (SPZ) and there are no groundwater SPZs recorded within 1km of the site boundary.

There are no discharge consents to groundwater recorded within a 500m radius of the site boundary.

There are no groundwater abstractions recorded by Envirocheck within a 600m radius of the site boundary. The closest abstraction consent is recorded approximately 620m to the north-east of the site at a well at Home Farm in Harmondsworth, operated by R & R Barwick. This permit was authorised in July 2001 and appears to remain active.

The combined groundwater vulnerability on site is considered by Envirocheck to be medium. This rating is due to the presence of Unproductive Strata, the London Clay Formation below the site, overlain by a limited thickness of Alluvium (Secondary A Aquifer) and the Taplow Gravel Member (Principal Aquifer) with mixed flow and an intermediate pollutant speed). Given the hydrogeological status of the site, the groundwater beneath the site is considered to be of moderate sensitivity with regards to near surface contamination. This takes into account the presence of a Secondary A Aquifer and a Principal Aquifer at a shallow depth on site (but afforded protection by the underlying London Clay Formation), the absence of groundwater abstractions within a 600m radius of the site, the absence of groundwater SPZs within 1km of the site and the presence of Duke of Northumberland´s River immediately west of the site.

The Envirocheck Report does not record a significant risk relating to the presence of soluble rocks on site.

No Water Industry Act referrals have been recorded with respect to groundwater discharges within 350m of the site boundary. The closest entry (permit reference: AM9390) within the Envirocheck Report relates to Prospect Park Landfill Site on Bath Road approximately 354m north-west of the site, operated by British Airways Plc. This was issued in April 1994 for processes which result in the discharge of Special Category effluents under The Trade Effluents (Prescribed Processes and Substances) Regulations. This application is recorded within the Envirocheck as having been cancelled.

3.5 Hydrology

The Envirocheck Report details that the closest surface water feature to the site relates to Duke of Northumberland´s River, which lies approximately 5m to the west of the site boundary, running north to south, parallel to the site boundary. Various further waterbodies are present within the wider area to the

west, north-west and south-west of the site from 50m from the site boundary and include Swan Lake, the River Colne (of which Duke of Northumberland´s River is a tributary), Longford River and Saxon Lake.

The closest surface water abstraction to the site is recorded approximately 266m south of the site boundary and relates to Headworks of Dnr on Bath Road for use in construction, operated by British Airways plc. This abstraction permit dates to January 2004 and appears to remain active. One further surface water abstraction is recorded approximately 344m north-west and relates to the abstraction of surface water from the River Colne at Prospect Park for use in transport processes, operated by British Airways plc. No further surface water abstractions are recorded within 650m of the site boundary.

The closest pollution incident to the site boundary, recorded by Envirocheck, is recorded approximately 247m to the south-west of the site and took place in January 1996 in Prospect Park. This related to the spillage of a miscellaneous (other) pollutant and was classified as a Category 3 (minor) incident. A further two Category 3 (minor) incidents were recorded between 270m and 570m from the site boundary and related to the spillage of a miscellaneous (other) pollutant. No Category 1 or 2 (major or significant) incidents were recorded within 1km of the site boundary.

There are no substantiated pollution incidents recorded within a 650m radius of the site boundary by Envirocheck.

According to Envirocheck records, there are no discharge consents to surface water recorded on site or within a 100m radius of the site. The closest discharge consent to the site relates to a location on Colnbrook By-Pass, operated by the National Data Processing Service, approximately 109m to the south of the site. The consent was issued for the discharge of trade discharges (cooling water) into a freshwater stream / river in January 1977 and was revoked in February 1990. A further consent is listed by Envirocheck approximately 126m south of the site at 476 Bath Road, operated by Waterlife Research Industries Ltd. The consent was issued for the discharge of other matter (fish farm) into Duke of Northumberland´s River in May 1981 and was revoked in August 1990. Five further discharges including trade discharges (mineral workings), unknown discharges and sewage discharges (pumping station – Water Company) are recorded to surface water between 200m and 500m from the site boundary.

There are no Integrated Pollution Prevention Controls (IPPC) or Integrated Pollution Controls (IPC) recorded within a 1km radius of the site boundary.

The closest Local Authority Pollution Prevention Controls (LAPPC) to the site boundary are recorded approximately 355m to 368m to the south-east of the site at Shell Peggy Bedford Service Station (which includes a McDonalds restaurant) on Bath Road. This relates to a PG1/14 petrol filling station and remains authorised. No further LAPPC are recorded within a 725m radius of the site boundary.

There are no records for enforcement and prohibition notices or prosecutions relating to authorised processes listed within 1km of the site within the Envirocheck Report.

No Water Industry Act referrals have been recorded with respect to surface water discharges within 1km of the site boundary.

3.6 Flood Risk

The site is listed as having the potential for groundwater flooding to occur at the surface on site and within the surrounding area. No potential for groundwater flooding of property situated below ground level is recorded within a 100m radius of the site boundary.

The site falls within a Flood Zone 1 area and is therefore at low probability of flooding (less than 0.1% probability of flooding within a given year). However, the land immediately adjacent to the site to the west, on either side of Duke of Northumberland´s River lies within a Flood Zone 2 and 3 area and has a medium to high probability of flooding or extreme flooding from rivers or seas without defences (between 0.1% and

1% probability of flooding within a given year). The site does not benefit from flood defences and there are no flood water storage areas in the vicinity of the site.

No further consideration of flood risk is given in this report. Specialist flood risk advice should be sought with regards to drainage and flooding to support the proposed scheme.

3.7 Unexploded Ordnance

In general accordance with the CIRIA report C681 (Stone et al 2009) a non-UXO specialist screening exercise has been carried out for the site as detailed below.

The Zetica bomb risk map for the area (Harmondsworth) indicates that the site is within an area with a low bomb risk. Areas designated as low risk are those assigned to areas with an estimated bombing density of less than 15 bombs per 1,000 acres with no or limited significant potential WWII targets present locally. A review of historical mapping for the site did not reveal any post-WWII UXO damage on site or immediately adjacent to the site. The site was within a largely rural area at the time of WWII. Wider areas around the site were shown to have a low to high bomb risk. A copy of the UXO map is presented in Appendix D.

Further action to mitigate the risk is considered prudent by Zetica, although not essential. Further consideration to the potential for UXO to be present at the site must be considered as part of any proposed development works.

3.8 Ground Stability

The potential ground stability hazards associated with the geology at the site, as outlined in the Envirocheck Report, have been summarised below in Table 3.

Table 3: Ground Stability Risks

Ground Stability Issue	Risk Level
Collapsible Ground	Very Low Risk
Compressible Ground	Moderate Risk
Ground Dissolution	No Hazard
Landslide Ground Instability	Very Low Risk
Running Sand	Low Risk
Shrinking or Swelling Clay	Low Risk

3.9 Radon

The site is indicated within the Indicative Atlas of Radon for England and Wales and the Envirocheck Report to be in a lower probability radon area, with less than 1% of homes estimated to be at or above the action level. Therefore, the BGS and the Building Research Establishment Radon Guidance Document indicate basic radon protection measures are not required in the construction of new homes, buildings, or extensions at the site.

3.10 Waste Management and Landfill

There are no BGS recorded landfill sites or Local Authority recorded landfill sites recorded within a 900m radius of the site boundary.

The closest historical landfill site is recorded by Envirocheck approximately 266m north-west of the site, operated by D & H Reclamation Ltd, located to the south of Moor Lane. The first input at this facility dates to December 1963, with no last input recorded. Deposited wastes included industrial waste. A further historical landfill site is recorded on Accommodation Lane, approximately 303m west of the site. The first input at this facility dates to December 1972 and had ceased by December 1973. Deposited wastes included inert waste. A further nine historical landfill sites are recorded between 500m and 1km from the site boundary, relating to inert waste, industrial, commercial, household and unspecified waste disposal operations. Infilling appears to be localised and is recorded by Envirocheck to have taken place between 1940 and 1993.

There are three licensed waste management facilities recorded between 300m and 500m of the site. The closest facilities relate to landfills taking other wastes (construction, demolition and dredgings), operated by British Airways plc and Suez Environment Ltd approximately 318m to 482m to the west and north-west of the site at Heathrow Landfill, located Prospect Park on Accommodation Lane. The permits for this facility were issued in 1980 and 1995. All entries list the waste management operations as closed. No further licensed waste management facilities are recorded within a 700m radius of the site boundary.

No registered waste transfer site are recorded by Envirocheck within a 700m radius of the site boundary.

There are no registered landfill sites recorded within a 550m radius of the site. The closest is recorded facility is approximately 577m to the north-west of the site boundary at Prospect Park, operated by British Airways plc. This facility is recorded as a large landfill site with treatment (equal or greater than 75,000 and less than 250,000 tonnes per year). This facility dates to 1995 and is recorded by Envirocheck as operational as far as is known. Authorised wastes include industrial and inert wastes. Landfill gas controls are recorded to be in place at this facility. Additional landfill sites are recorded over 575m from the site boundary within the wider area.

There are no registered waste treatment or disposal sites recorded within 1km of the site boundary according to Envirocheck records.

3.11 Hazardous Substances

No records of planning hazardous substance consents or enforcements, Control of Major Accident Hazards (COMAH) or Notification of Installations Handling Hazardous Substances (NIHHS) sites have been identified within 1km of the site.

There are no explosive sites recorded by Envirocheck within a 1km radius of the site and there are no registered radioactive substances recorded within 1km of the site boundary.

The closest entry for registered radioactive substances is recorded approximately 154m to the north-west of the site boundary. This relates to the disposal of radioactive waste at Waterside British Airways International Headquarters Facility, operated by British Airways plc. No further entries relating to registered radioactive substances are recorded within a 650m radius of the site boundary.

3.12 Contemporary Trade Directory Entries

There are no contemporary trade directory entries recorded on site or within a 100m radius of the site boundary.

There are twenty entries recorded 124m and 125m south of the site at Abbey House at 450 Bath Road. The active entries relate to airfreight services, office furniture and equipment, garage services, road haulage services and waste disposal services. Inactive entries include freight forwarders, car dealers, computer recycling and disposal, electrical engineers, domestic cleaning services, car engine tuning and diagnostic services, plastics (raw materials), distribution services, energy efficient products and services and

commercial cleaning services.

Active garage services are recorded approximately 153m to the north-east of the site. No further active entries are recorded within a 250m radius of the site. Further inactive entries are recorded between 150m and 250m of the site and include swimming pool contractors, repairers and servicing, road haulage services and motorcycle and component manufacturers.

The closest fuel station entry to the site is recorded at 400 Colnbrook By-Pass and relates to Shell Heathrow approximately 355m to the south-east of the site boundary. The fuel station is listed by Envirocheck as open.

3.13 Sensitive Land Uses

The Envirocheck Report indicates that the site is not within an area of Adopted Greenbelt but lies immediately adjacent to greenbelt land which lies to the west of the site.

The site is recorded to be located within the Colne and Guc (from confluence with Chess to Ash) Nitrate Vulnerable Zone (NVZ) relating to surface water. No further NVZs are recorded within a 1km radius of the site boundary.

The site lies adjacent to the Harmondsworth Conservation Area, the boundary of which adjoins the eastern edge of the wider site. No listed buildings or scheduled monuments fall within or immediately adjacent to the application boundary.

There are no Sites of Special Scientific Interest (SSSI), Local Nature Reserves (LNR), National Parks, Ancient Woodland, Areas of Outstanding Natural Beauty (AONB) or other sensitive land uses are located within 1km of the site.

3.14 Invasive Weeds

During the site walkovers, evidence of invasive weeds, including Japanese Knotweed were observed. Although a visual inspection was carried out, this does not represent a full invasive weeds survey and as such may need to be carried out by a specialist.

4. London Borough of Hillingdon Local Authority Search

4.1 Planning Portal Search

A search of the London Borough of Hillingdon planning portal was undertaken for the site and the immediate area on the 8th May 2026. No planning applications relating to the proposed redevelopment scheme at the site had been submitted at the time of writing.

One historic planning application (planning reference: 8190/APP/2017/564) for the creation of a new 164-space staff car park on site was refused in 2017. No further historical applications for the site were recorded on the planning portal.

No previous ground investigations are recorded to have taken place at the site based on available records on the London Borough of Hillingdon planning portal.

5. Preliminary Risk Assessment and Exposure Model

A Conceptual Site Model (CSM) represents the possible relationships between potential contaminant sources, pathways, and receptors in line with the Statutory Guidance to Part 2a of the Environmental Protection Act 1990. The following Preliminary Risk Assessment is based on the results of the Desk Study and the site walkover.

5.1 Potential Contamination Sources and Contaminants of Concern

On-site

- No worked or artificial ground has been identified on site by Envirocheck or the BGS. However, Made Ground is anticipated to be present beneath the site due to the widespread presence of hardstanding. According to mapping records, no historical demolition has been carried out on site. As such, the thickness of any Made Ground is unlikely to be extensive or particularly contaminative in nature and is unlikely to pose a significant contamination risk to the proposed redevelopment scheme.

- The recent and existing use of the site as a car park poses limited contamination risk. There is the potential for localised leakage or spills, though no evidence of leakage or spillage was seen anywhere on site during the site walkover and no pollution incidents have been recorded on site or within a 225m radius of the site by Envirocheck.

- During the site walkover, limited waste materials were noted on site. These materials will be removed as part of the proposed scheme and are not considered to pose a risk to the site.

- There is not considered to be a potential ground gas risk on site from ground gas or vapours generated from Made Ground on site. This is due to the assumed limited thickness of Made Ground given the absence of demolition on site and due to the absence of buildings and structures (and any such enclosed spaces) within the proposed redevelopment scheme.

- The various on-site contaminants of concern could include heavy metals and metals, Asbestos-Containing Materials (ACMs), Total Petroleum Hydrocarbons (TPH), pH and Poly-cyclic Aromatic Hydrocarbons (PAHs).

Off-site

- Worked or artificial ground has been identified from approximately 50m west and north-west of the site, in and around the location of the existing Waterside British Airways International Headquarters Facility, which appears to have been former gravel workings, with subsequent landfilling and land raising. It is understood that some remedial action was carried out on this site to render it suitable for use as a corporate office building. On this basis and given the nature of the site use as a car park with no buildings and structures (and any such enclosed spaces), this former land use poses a negligible risk to the proposed redevelopment scheme.

- Similarly, wider landfilling operations over 250m from the site are considered highly unlikely to pose a risk to the proposed redevelopment scheme, given the distance from the site boundary, the extent of remedial action that appears to have been undertaken at these facilities and / or the nature of the site use as a car park with no buildings and structures (and any such enclosed spaces).

- The contemporary and historical industrial and commercial land uses present within the wider area around the site, including the adjacent Colnbrook Immigration Removal Centre (and previous uses as Road Research Laboratory, government offices, a computer centre and works) and wider commercial and industrial operations are considered to pose a limited risk to the site and are not anticipated to have comprised potentially contaminative activities. Any impacts to ground conditions on site, in the unlikely

event that they are present, are likely to be very localised and will not pose a risk to the proposed redevelopment scheme.

- Nearby electrical infrastructure associated with electricity sub-stations (constructed in the 1970s) located over 50m from the site boundary are considered to pose a limited risk to the site. This is due to their respective distance from the site and the nature of this land use.

- There are various contemporary trade directory entries and a fuel station entry recorded over 120m and 350m respectively from the site boundary by Envirocheck. Given the distance from the site and / or the nature of these land uses, they are considered to pose a very low risk to the site.
- The surrounding residential properties, offices, commercial and industrial operations, as well as nearby public and leisure facilities are not considered to pose a potential risk to the site or proposed redevelopment scheme due to the non-contaminative nature of these land uses and / or their respective distances from the site.

- The various off-site contaminants concern could include heavy metals and metals, ACMs, Total TPH, pH, PAHs and Poly-Chlorinated Biphenyls (PCBs).

5.2 Potential Pathways

There are limited viable pathways for direct human contact and ingestion by future site users including staff, visitors, and neighbours due to the presence of peripheral soft landscaping (which is not for recreational use) only on site. The potential pathways identified for the site include the following:

- Inhalation (dust inhalation in during construction and future maintenance works).
- Direct contact with aggressive ground conditions.
- Leaching and migration via groundwater and surface water (reduced due to the presence of widespread hardstanding and building footprints across much of the site area).

5.3 Potential Receptors

The potential receptors identified for the site include the following:

- Future site end users (future site users including staff, visitors, and neighbours).
- Groundworkers (construction and future maintenance workers).
- Building materials (buried concrete and underground services).
- Controlled waters: Groundwater (underlying and nearby Secondary A Aquifer and Principal Aquifer including the Alluvium, Taplow Gravel and Lambeth Group) and surface waters (surface water run-off, Duke of Northumberland´s River and wider surface water network including the River Colne and Longford River).

5.4 Summary of Potential Contaminant Linkages

Table 5 lists the plausible contaminant linkages identified for the site.

These are considered as potentially unacceptable risks in line with guidelines published in CLR 11, and subsequent risk assessment has therefore been undertaken. Linkages have been assessed in general accordance with guidance provided in the CIRIA Report C552 (Rudland et al 2001) but with the addition of a ‘no linkage’ category as detailed in Table 4.

It should be noted that whilst the risk assessment process undertaken in this report may identify potential risks to groundworkers (construction and future maintenance workers), consideration of occupational health and safety issues is beyond the scope of this report and needs to be considered separately in the Construction Phase Health and Safety Plan. This will include good site practices such as dust suppression and the use of Personal Protective Equipment (PPE).

Table 4: Risk Assessment Process

	Consequence			
Probability	**Severe**	**Medium**	**Mild**	**Minor**
High Likelihood	Very high risk	High risk	Moderate risk	Low risk
Likely	High risk	Moderate risk	Low risk	Very low risk
Low Likelihood	Moderate risk	Low risk	Low risk	Very low risk
Unlikely	Low risk	Very low risk	Very low risk	Very low risk
No Linkage	No risk			

The information gathered in this Phase 1 Preliminary Contamination Risk Assessment Report has been compiled to produce a Conceptual Site Model (CSM), which is summarised in Table 5.

Table 5: Conceptual Site Model

Potential Site Contaminant Sources	Potential Pathways	Potential Receptors	Pathway Complete	Risk Level Classification
<u>On-Site</u> Made Ground (associated with the existing use of the site as a car park with widespread hardstanding). Recent and historical usage of the site as a car park. <u>Off-Site</u>	Direct inhalation	Current site users (no buildings and widespread hardstanding)	Yes (very limited)	Very Low (recent and current use of the site as a car park but limited period of exposure and majority of site covered with widespread hardstanding)
	Inhalation of wind-blown dust		Yes (very limited)	Very Low (recent and current use of the site as a car park but limited period of exposure and majority of site covered with widespread hardstanding)
	Ground gas and vapour generation and migration		Yes (very limited)	Very Low (recent and current use of the site as a car park but limited period of exposure and majority of site covered with widespread hardstanding)

Potential Site Contaminant Sources	Potential Pathways	Potential Receptors	Pathway Complete	Risk Level Classification
Historic gravel pits with subsequent landfilling and land raising >50m from the site Electricity sub-stations > 50m from the site Contemporary and historical industrial and commercial land uses within the wider area >120m from the site Fuel station >350m Contaminants of Concern: heavy metals, metals, ACMs, TPH, PCBs, pH and PAHs.	Dermal / direct contact	Future site users (equivalent to industrial and commercial land use and includes construction and maintenance workers)	Yes (construction and maintenance workers only)	Very Low (recent and current use of the site as a car park but limited period of exposure and majority of site covered with widespread hardstanding within final scheme)
	Direct ingestion		Yes (construction and maintenance workers only)	Very Low (recent and current use of the site as a car park but limited period of exposure and majority of site covered with widespread hardstanding within final scheme)
	Direct inhalation		Yes (very limited)	Very Low (recent and current use of the site as a car park but limited period of exposure and majority of site covered with widespread hardstanding within final scheme)
	Inhalation of wind-blown dust		Yes (very limited)	Very Low (recent and current use of the site as a car park but limited period of exposure and majority of site covered with widespread hardstanding within final scheme)
	Ground gas and vapour generation and migration		No	N/A
	Direct contact	Services (following redevelopment)	Yes (very limited)	Very Low (presence of Made Ground on site)
	Migration of contaminants off-site: non-aqueous phase		Yes (very limited)	Very Low (presence of Made Ground on site)
	Migration of contaminants off-site: aqueous phase		Yes (very limited)	Very Low (presence of Made Ground on site)
	Migration of contaminants off-site: non-aqueous phase	Adjacent residential, industrial and	Yes	Very Low (presence of Made Ground on site)

Potential Site Contaminant Sources	Potential Pathways	Potential Receptors	Pathway Complete	Risk Level Classification
		commercial properties		
	Migration of contaminants off site: aqueous phase		Yes	Very Low (presence of Made Ground on site)
	Vapour migration		No	N/A
	Migration of contaminants from site: non-aqueous phase	Controlled groundwater and surface waters (Secondary A Aquifer, Principal Aquifer, Duke of Northumberland´s River and nearby watercourses)	Yes	Low (Made Ground on site with widespread hardstanding limiting infiltration)
	Migration of contaminants from site: aqueous phase		Yes	Low (Made Ground on site with widespread hardstanding limiting infiltration)

5.5 Summary of Potential Contaminant Risks

The preliminary contamination risk assessment has identified complete source-pathway-receptor linkages with a maximum **Low** risk level from the potential contamination sources and risk drivers identified on the site and surrounding area. On this basis, a site-wide ground investigation is not considered to be required at the site to support the proposed redevelopment scheme at this stage from a contaminated land perspective.

Within the proposed development scheme, the site will be covered in widespread hardstanding meaning exposure will be very limited. Limited peripheral soft landscaping only around the car parking spaces is proposed. There are not considered to be potentially significant source drivers representing a risk to future site users, nearby site users, services and to controlled waters (principally the underlying Secondary A Aquifers and Principal Aquifer) on site. No potentially significant sources of contamination have been identified on site or within the immediate surrounding area as part of this Phase 1 Desk Study.

Recommendations for further works at the site are provided in Section 7 of this report.

6. Geotechnical Hazard Identification

Potential geotechnical hazards have been identified by Envirocheck during the Phase 1 Desk Study. These issues are presented below:

- Excessive settlement (creep and inundation settlement or differential settlement of foundations) or unstable, poor-quality material within any Made Ground present on site.
- Attack of buried concrete by aggressive ground conditions.
- There is a moderate risk from compressible ground on site and within the wider area associated with the presence of Alluvium Superficial Deposits on site.
- The site is listed as having the potential for groundwater flooding at the surface to occur on site and within the surrounding area.

7. Conclusions and Recommendations

7.1 Risk Evaluation

Based on historic land uses and its current operational use, the overall risk from land contamination at the site is **low** based on the continued use of the site as a car park associated with the adjacent Colnbrook Immigration Removal Centre.

It is unlikely that the site would be classified as Contaminated Land under Part 2a of the EPA 1990 however this has not been formally confirmed by the Local Authority.

Table 5 provides a summary of the geo-environmental risks identified and the overall risk associated with the site has been designated using qualitative judgement using the risk categories provided in Table 6.

Table 6: Assessed Overall Risk Categories for the Site from Land Contamination

Risk Category	Definition
Very High Risk	A significant contaminant linkage, including actual evidence of significant harm or significant possibility and significant harm, is clearly identifiable at the site (e.g. from visual or documentary evidence) under current conditions, with potential for legal and / or financial consequences for the site owner or other Responsible Person. Remediation advisable based on acute impacts being likely. Immediate action should be considered.
High Risk	A contaminant linkage is identifiable on site under current and future use conditions. Although likely, there is no obvious actual evidence of significant harm or significant possibility and significant harm under current conditions. Extent of risk is therefore subject to confirmation by investigation and risk assessment, and most likely to be deemed significant. Realisation of the risk is likely to present a substantial liability to the site owner or other Responsible Person. Remediation required for redevelopment and may also be required under Part 2A for existing receptors.
Moderate Risk	A contaminant linkage is identifiable on site under current and future use conditions. However, it is not likely to be a significant linkage under current conditions. It is either relatively unlikely that any such harm would be severe, and if any harm were to occur it is more likely, that the harm would be relatively mild. Actual extent of risk subject to confirmation by additional investigation and risk assessment and most likely to lie between no possibility of harm (under current conditions) and significant possibility of significant harm (under conditions created by new use). Remediation may be required for redevelopment.
Low Risk	Potential pathways and receptors exist but history of contaminative use or site conditions indicates that contamination is likely to be of limited extent and below the level of possibility of harm. Unlikely that the site owner or other Responsible Person would face substantial liabilities from such a risk. Precautionary investigations and risk assessment advisable on change of use. Any subsequent remedial works are likely to be relatively limited.
Very Low Risk	No contaminant linkage likely to exist under current or future conditions, but this cannot be completely discounted. If harm is realised, it is likely at worst to be mild or minor. Site not capable of being determined under Part 2A (in accordance with PPS23) where the Local Authority inspects the site. No further action needed.
No Risk	No contaminant linkage exists.

7.2 Recommendations for Future Work

Based on the findings of this report, the risks to human health receptors and services from contamination at the site is considered to be **low** and the risks to controlled waters are also considered to be **low**.

On this basis, a comprehensive site-wide ground investigation is not considered to be required at the site to support the proposed redevelopment scheme at this stage from a contaminated land perspective.

Additional Recommendations

During any future below ground works, a watching brief for contamination will need to be maintained. Should any unexpected contamination such as hydrocarbon staining, odours or ACMs be identified during any future groundworks, such as evidence of the use of former chemicals or the burial of waste on site, then a suitably qualified and experienced geo-environmental engineer should be consulted and if necessary further assessment should be undertaken.

It should be noted that the risk assessment undertaken as part of this Desk Study has assumed that appropriate PPE and working practices will be put in place by contractors, to ensure that site workers are protected from contamination which may be present at the site. Appropriate Health & Safety precautions, including dust suppression will need to be implemented during construction works to ensure the protection of site users, workers, and neighbours.

Any changes to the proposed scheme could change the risk assessment contained within this report and would need to be reviewed and updated accordingly.

Geotechnical Recommendations

Detailed geotechnical assessment should be carried out to ensure the proposed car park on site are appropriate given the ground conditions present.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Ove Arup Copyright Notice

The Mining Instability data was obtained on licence from Ove Arup & Partners Limited (for further information, contact mining.review@arup.com). No reproduction or further use of such Data is to be made without the prior written consent of Ove Arup & Partners Limited. The supplied Mining Instability data is derived from publicly available records and other third party sources and neither Ove Arup & Partners nor Landmark warrant the accuracy or completeness of such information or data.

Stantec Copyright Notice

The cavity data presented has been extracted from the PBA (now Stantec UK Ltd) enhanced version of the original DEFRA national cavity databases. Stantec UK Ltd retain the copyright & intellectual property rights in the data. Whilst all reasonable efforts are made to check that the information contained in the cavity databases is accurate we do not warrant that the data is complete or error free. The information is based upon our own researches and those collated from a number of external sources and is continually being augmented and updated by Stantec UK Ltd. In no event shall Stantec UK Ltd or Landmark be liable for any loss or damage including, without limitation, indirect or consequential loss or damage arising from the use of this data.

Radon Potential dataset Copyright Notice

Information supplied from a joint dataset compiled by The British Geological Survey and Public Health England. The probability result is only valid for properties above ground. All basement and cellar areas are considered to be at additional risk from high radon levels. If an underground room such as a cellar or basement makes up part of the living or working accommodation, the property should be tested regardless of Radon Affected Area status.

Report Section and Details	Page Number
Summary	-
The Summary section provides an overview of the data contained within the report, detailing the number of data set features or the existence of a data set in relation to the buffer selected. For ease of reference, the report is broken down into 4 sections of data; Mining and Natural Cavities Data, Historical Land Use Information (1:2,500), Historical Land Use Information (1:10,000) and Ground Stability Data (1:50,000).	
Mining and Natural Cavities Data	1
The Mining and Natural Cavities Data section features data sets related to the existence of mining areas and their potential hazards; and details of naturally formed cavities. Data sets within this section are not plotted, with the exception of BGS Recorded Mineral Sites and Potential Mining Areas which feature on the Historical Land Use Information (1:10,000) map.	
Historical Land Use Information (1:2,500)	4
The Historical Land Use Information (1:2,500) section contains data captured from analysis carried out by Landmark of 1:1,250 and 1:2,500 scale historical Ordnance Survey mapping, identifying areas where, historically, the land uses were potentially contaminative. For the purpose of this Envirocheck module, only historical data relating to mining and ground stability has been included and plotted on the corresponding Historical Land Use Information (1:2,500) map. This section also includes the Subterranean Features data set, which details various man-made and man-used underground spaces obtained from the Subterranea Britannica society.	
Historical Land Use Information (1:10,000)	5
The Historical Land Use (1:10,000) section covers data captured from the systematic analysis carried out by Landmark of 1:10, 560 and 1:10,000 scale historical Ordnance Survey mapping dating back to the mid-19th century, identifying potentially contaminative past industrial land uses. For the purpose of this Envirocheck module, only data relating to mining and ground stability has been included and plotted on the accompanying Historical Land Use Information (1:10,000) map.	
Ground Stability Data (1:50,000)	6
The Ground Stability (1:50,000) section includes the BGS Geosure data suite, reporting features to 250m and plotted onto 3 separate maps. Also reported is brine subsidence, brine mining and salt mining data sets, of which Brine Pumping and Salt Mining Related Features are plotted, and subsidence insurance claims and insurance investigations data, which is not plotted.	
Historical Map List	8
The Historical Map List section details the historical mapping that has been analysed for your site, in relation to the Historical Land Use Information sections.
