1.0 Authorisation, Context and Purpose

1.1 Authorisation

Evolve Geo-Environmental Limited (EGE) was instructed by Howard Ward Associates (HWA, the 'Client') to undertake a Preliminary (Geo-Environmental) Risk Assessment (PRA) for Stockley Park, Uxbridge (the 'Site').

A Site Location Map is included as Figure I.

1.2 Context and Purpose

This Report has been undertaken in general accordance with:

- ▽ Guidance on Land Contamination: Risk Management pages of the [GOV.UK](https://www.gov.uk) web pages;
- ▽ The relevant requirements of the National Planning Policy Framework 2024 (NPPF) (paragraphs 187 & 196 - 201) [National Planning Policy Framework - 15. Conserving and enhancing the natural environment - Guidance - GOV.UK \(www.gov.uk\)](https://www.gov.uk/guidance/national-planning-policy-framework-2024); and
- ▽ The Planning Practice Guidance (Land Affected by Contamination) <https://www.gov.uk/guidance/land-affected-by-contamination>.

The purpose of this Report is to identify potential soil and groundwater issues beneath the Site associated with any plausible sources of contamination. In addition, this Report is designed to provide preliminary information for any possible geotechnical constraints/issues and likely foundation requirements.

1.3 Proposed Development and Planning

It is understood that the proposed development at the Site comprises demolition of the existing office buildings and redevelopment of two (2 no.) warehouse buildings (Unit 100 & 200) with office space. The warehouse area is proposed to comprise 5,697 m² and 4,909 m² while the office space will comprise 847 m² and 614 m² for Unit 100 and Unit 200, respectively.

A Proposed Site Plan is included as Drawing I.

At the time of writing this Report, no planning application relating to the proposed development was on the Borough of Hillingdon Council online planning portal.

1.4 Limitations

The EGE standard limitations are included as Appendix I. No specific on-Site limitations were encountered.

1.5 Scope of Works

The following Scope of Works was completed:

- ▽ Obtain and review Envirocheck ® Report (historical mapping and regulatory database information);
- ▽ Complete inspection of the Site;
- ▽ Review relevant planning applications, where available;
- ▽ Review third party reports provided by the Client or obtained via the Planning records, where available;

Preliminary (Geo-Environmental) Risk Assessment (PRA)

Stockley Park, Uxbridge
EGE-25-06-13-01

- ▽ Obtain a Contaminated Land Search information request from Borough of Hillingdon Council for the Site; and
- ▽ Provide a Report summarising the above information to formulate a conceptual Site model (CSM) identifying possible pollutant linkages in the context of the proposed development.

In providing this Assessment, in addition to the information detailed above, EGE has utilised the following freely available data sources:

- ▽ British Geological Survey (BGS) data;
- ▽ www.zeticauxo.com mapping;
- ▽ [Free topographic maps, elevation, terrain \(topographic-map.com\)](http://topographic-map.com);
- ▽ [Mining Remediation Authority Map Viewer](#)
- ▽ [Search planning applications - Hillingdon Council](#) Borough of Hillingdon Council online planning portal;
- ▽ Borough of Hillingdon Council Contaminated Land Register on their Contaminated Land Website ([Contaminated land public register - Hillingdon Council](#));
- ▽ Google Earth™;
- ▽ <http://www.magic.defra.gov.uk/MagicMap.aspx> mapping;
- ▽ Historic England, August 2020. Stockley Park: Business park Phase I and II, and country park and golf course. www.historicengland.org; and
- ▽ ULI Development Case Studies, Stockley Park Reference. C031002, Dated 2001.

1.6 Additional information Sources

EGE has been provided with the following drawings:

- ▽ UMC Architects, Proposed Site Layout, 1&2 Longwalk Road, Stockley Park, Uxbridge, Drawing No. 23517-UMC-ZZZZ-SI-DR-A-0601-P02, dated 13th November 2023 (Drawing I).

In addition to the above, EGE has been provided with the following information for the Site:

- ▽ Desk Study Report, by Hydrock Consultants Limited (Hydrock), at 1 Longwalk Road, Stockley Park, Reference: 13724-HYD-XX-XX-RP-GE-1000, Dated December 2022.

Furthermore, EGE has obtained the following information through the Borough of Hillingdon Councils online planning portal for developments in the surrounding Site area:

Prologis Park, West London:

- ▽ Stockley Park Phase 3 Pre-Development Environmental Site Investigation by Ove Arup and Partners Arup Geotechnics, dated February 1998;
- ▽ Stockley Park Phase 3 Geotechnical Interpretative Report by Arup Geotechnics, dated December 2000;
- ▽ Stockley Park Phase 3 (Dawleywood) Remediation Report by Arup, dated May 2001;
- ▽ Environmental Statement (ES) Volume 1: Stockley Park Phase 3 by WSP, dated June 2007;
- ▽ ES Volume 1: Main Text Stockley Park Phase 3 by Arup, dated September 2009;

Preliminary (Geo-Environmental) Risk Assessment (PRA)

2.0 Site Details and Data Review

Information regarding the Site details, Site history and regulatory database information is provided with the following Sections.

2.1 Site Setting

<p>Co-ordinates, Area and Elevation</p>	<ul style="list-style-type: none"> ▽ National Grid Reference (NGR) 507790, 180240 (centred); ▽ Approximately 2.42 Hectares (ha); and ▽ Site surface is circa 35.0 - 36.0 metres (m) above ordnance datum (AOD).
<p>General Location</p>	<p>The Site is located approximately 1.0 km south-west of Hayes and approximately 3.5 km north of Heathrow Airport.</p> <p>A Site Location Map is included as Figure I.</p>
<p>Current Site Use and Walkover Information</p>	<p>A Site walkover was undertaken by an EGE representative on 23rd June 2025. A Relevant Features Plan is included as Figure II and the current Site layout can be seen within the 2024 1:10,000 OS Vector Map included within Appendix II (Envirocheck Report: 379502316_1_1).</p> <p>The Site comprised a parcel of land split north and south, into two commercial office plots:</p> <ul style="list-style-type: none"> ▽ 1 Longwalk Road, Stockley Park; and ▽ 2 Longwalk Road, Stockley Park. <p>The generally topography of the Site was noted to be flat and level with a short slope present from a high point on the north, down to the south along the boundary between the two plots.</p> <p>No evidence of bulk hydrocarbon storage was noted during the Site walkover, furthermore, no suspected asbestos containing materials were encountered at the Site. However, Given the age of the buildings located on-Site, asbestos containing materials may be present within their construction.</p> <p>Areas of localised hydrocarbon staining were present atop of the brick-weave car parking areas across the Site.</p> <p><u>1 Longwalk Road, Stockley Park</u></p> <p>The commercial office building was located in the central north-east of the Site, noted to comprised a two-storey suspected steel framed building with two symmetrical white clad wings complete with a central cylindrical glass reception.</p> <p>Soft landscaping and well-kept vegetation covered the eastern and northern areas of the plot whilst a water feature (Approx 4.0 x 4.0 m) was present in the north-eastern corner of the Site.</p> <p>The western, central and southern areas of the plot comprised car parking and road access off Longwalk Road, located in the south-eastern corner of the plot.</p> <p>An electricity sub-station and commercial bins storage area was located in the centre of the car park in the north-west of the Site.</p>

	<p><u>2 Longwalk Road, Stockley Park</u></p> <p>The commercial office building 2 Longwalk Road was located in the south-eastern quarter of the Site, noted to comprise a two-storey suspected steel framed building with a symmetrical and rectangular construction complete with a projecting central entrance block. The walls of the building were orange and light grey panels. The central roof section contained roof-mounted equipment and utilities.</p> <p>Soft landscaping and well-kept vegetation covered the northern, eastern and southern areas of the plot. The remaining areas across the plot comprised car parking and road access from Longwalk Road, located in the south-eastern corner of the Site.</p> <p>An electricity sub-station and commercial bins storage area was located in the centre of the car park in the south-west of the Site.</p> <p>At the time of the walkover, the building was undergoing a commercial rip-out. Associated skips were located adjacent to the electricity sub-station. The contents of the skip included; bin bags, cardboard, ceiling tiles, metal storage cupboards and plastics.</p>
<p>Adjacent Land use</p>	<p>The Site is bound by the following land uses:</p> <ul style="list-style-type: none"> ▽ North - Bennetsfield Road with Stockley Park Golf Club beyond; ▽ East - Longwalk Road with a pond and the wider Stockley Park trading estate beyond; ▽ South - The wider Stockley Park trading estate; and ▽ West - Stockley Road with the wider Stockley Park trading estate beyond.
<p>Proposed Development</p>	<p>It is understood that the proposed development at the Site comprises demolition of the existing office buildings and redevelopment of two (2 no.) warehouse buildings (Unit 100 & 200) with office space. The warehouse area is proposed to comprise 5,697 m² and 4,909 m² while the office space will comprise 847 m² and 614 m² for Unit 100 and Unit 200, respectively.</p> <p>A Proposed Site Plan is included as Drawing I.</p> <p>At the time of writing this Report, no planning application relating to the proposed development was on the Borough of Hillingdon Council online planning portal.</p>
<p>Geology</p>	<p>Reference to the British Geological Survey (BGS) online viewer and mapping BGS mapping (1:50,000 Sheet Number 269, Winsor) indicates the Site is underlain by superficial deposits of the Lynch Hill Gravel Member (sand and gravel). Thereafter, the Site is mapped as being underlain by bedrock of the London Clay Formation (clay, silt and sand).</p> <p>Furthermore, the Site is mapped on the British Geological Survey (BGS) online viewer and mapping BGS mapping as comprising 'Worked Ground - Void'. This likely relates to the open cast extraction of the superficial sands and gravels.</p> <p>Given the developed nature of the Site and mapped 'Worked Ground - Void', Made Ground is anticipated. Finally, the Site is mapped as being located</p>

	<p>within an area of potentially infilled land (non-water) and as such the potential for deep Made Ground cannot be discounted at this stage.</p> <p>A BGS recorded historical borehole is located approximately 60 m west of the Site (Reference. TQ08SE208, dated April 1979) recording the following generalised geological sequence:</p> <ul style="list-style-type: none"> ▼ Made Ground: Dark grey sand and clay 'fill' with pockets of brown clay and occasional tile and clinker, to a depth of 1.75 m bgl, over; ▼ Very dense light brown angular to sub-rounded fine flint GRAVEL and coarse SAND with pockets of clay, to 3.00 m bgl, over; ▼ Firm orange brown mottled sandy CLAY with fine flint gravel, to 4.00 m bgl, over; ▼ Very dense light brown angular to sub-rounded coarse SAND and fine flint GRAVEL, to 7.20 m bgl, over; ▼ Boulder obstruction, to 7.50 m bgl, over; ▼ Firm to stiff orange brown mottled silty CLAY with occasional fine flint gravel, to 7.80 m bgl, over; ▼ Stiff blue grey fissured silty CLAY with silt dustings along fissures, to a maximum drilled depth of 10.00 m bgl, noted to comprise the London Clay Formation. 																					
<p>Hydrogeology</p>	<p>The Environment Agency classify the following:</p> <ul style="list-style-type: none"> ▼ Superficial Deposits: Lynch Hill Gravel Member - Principal Aquifer; and ▼ Bedrock: London Clay Formation - Unproductive Strata. <p>The Site is not located within a Source Protection Zone (SPZ). Furthermore, no SPZs are located within 1.0 km from the Site.</p> <p>There are 25 no. groundwater abstraction records within the Envirocheck report located within 1.0 km of the Site, summarised in the table below:</p> <table border="1" data-bbox="491 1263 1385 1870"> <thead> <tr> <th>Groundwater Abstraction Location</th> <th>Approximate Distance (m)</th> <th>Abstraction Records No.</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td rowspan="2">Stockley Park Golf Club</td> <td>180 - North-West</td> <td>5</td> <td rowspan="2">Golf courses: General Washing/Process Washing & Spray Irrigation</td> </tr> <tr> <td>221 - North-West</td> <td>1</td> </tr> <tr> <td rowspan="2">Stockley Park (Phase 3) - Borehole A</td> <td>262 - West</td> <td>7</td> <td>Business Parks: Make-Up or Top Up Water & Spray Irrigation</td> </tr> <tr> <td>324 - South-West</td> <td>1</td> <td>Business Parks: Make-Up or Top Up Water</td> </tr> <tr> <td>Unlined Lagoon Within Gravels At Stockley Park, Uxbridge</td> <td>290 - South-East</td> <td>1</td> <td>Business Parks: Trickle Irrigation</td> </tr> </tbody> </table>	Groundwater Abstraction Location	Approximate Distance (m)	Abstraction Records No.	Type	Stockley Park Golf Club	180 - North-West	5	Golf courses: General Washing/Process Washing & Spray Irrigation	221 - North-West	1	Stockley Park (Phase 3) - Borehole A	262 - West	7	Business Parks: Make-Up or Top Up Water & Spray Irrigation	324 - South-West	1	Business Parks: Make-Up or Top Up Water	Unlined Lagoon Within Gravels At Stockley Park, Uxbridge	290 - South-East	1	Business Parks: Trickle Irrigation

Hydrology	<p>The closest surface water feature is a pond located approximately 30 m east from the Site, furthermore, the Grand Union Canal is located approximately 225 m south.</p> <p>Three (3 no.) surface water abstractions are recorded within 1.0 km of the Site, approximately 260 m south and 348 m south, relating to mineral products extraction water and dust suppression from the Grand Union Canal.</p> <p>Groundwater within the BGS recorded historical borehole, located approximately 60 m west of the Site (Reference. TQ08SE208, dated April 1979) was noted to be between 1.78 and 1.85 m bgl.</p>			

2.2 Site History

Historical mapping dated between 1868 and 2025 is provided with the Envirocheck ® Report (379502316_1_1) and is summarised below and reproduced as Appendix II.

Historical Map Summary - Site	<p>From the earliest available map edition dated 1868, the Site comprised undeveloped land in likely agricultural use. The Site remained undeveloped until circa 1935 when two buildings are mapped in the south-western corner of the Site.</p> <p>By 1960, the buildings are no longer mapped and the Site is noted to comprise grassland / pasture with possible excavations also present.</p> <p>No changes are shown until 1975 when a wishbone shaped track is present on-Site, routed west / north-west to south-east.</p> <p>The Site is mapped as redeveloped by 1985, generally comprising the current Site layout; Two buildings, one in the north and one in the south, each with associated access, car parking, electrical sub-stations and public open space.</p> <p>Available historic satellite imagery dated 1945 to 2025 shows the car park for the northern building having comprised a construction compound in 2011 for the construction of two smaller outbuildings located along the northern boundary.</p>
Historical Map Summary - Surrounding Area	<p>Dating back to the earliest available map edition from 1868, the surrounding area of the Site was largely undeveloped and likely used for agricultural purposes. The Great Western Railway was located approximately 310m to the south, and the Grand Junction Canal lay 235m to the south-west. Four 'Brick Fields' were identified within 1.0km of the Site, the closest being 410m to the south-east.</p> <p>By 1895, both the size and number of brick pits in the surrounding area had increased. In addition, four gravel pits were recorded within 1.0 km, with the closest situated 260 m to the south-west. The Hillingdon Varnish Works had also been developed along the railway, 455 m to the south-west.</p> <p>By 1914, the brick and gravel pits had further expanded, with the closest located 25 m to the north-east and 140 m to the west, respectively.</p>

	<p>By 1935, a chemical works was present 335 m to the south-east. A white lead works had been established 670 m to the west, and a concrete works appeared 765 m west of the Site. Gravel and ballast pits to the west had also significantly expanded. A machine depot was recorded 770 m to the south-east, and a gramophone factory was located 1.07 km to the east.</p> <p>By 1960, the brick and gravel pits occupied much of the surrounding area, which was identified as rough pasture or grassland with excavations.</p> <p>By 1965, a piggery was mapped 55 m to the west.</p> <p>By 1967, further industrial development had occurred. A depot was present 145 m to the south-west, and a scrap metal yard was located 240 m to the south-west. A water body was recorded 20 m to the north. The former varnish works had been repurposed as a prefabricated panel works. A refuse tip was located 190 m to the south-east. A road reconstruction works and asphalt plant, including multiple tanks, was mapped 250 m to the south. Additionally, a plant depot with tanks was mapped 375 m to the south. A plastic works was situated 345 m to the south-east, and the gramophone factory had expanded, located 915 m to the south-east. A metal works was recorded 475 m to the south-east, while government offices and tanks appeared 495 m to the south. An RAF station was mapped 800 m to the south-west; however, buildings at this location had been mapped and unnamed since 1938.</p> <p>By 1987, the surrounding area had been redeveloped as the Stockley Park trading estate. The A408 flyover and Stockley Park Roundabout had been constructed immediately to the west. The previously mapped water feature 20 m to the north was shown as a small lake, with additional lakes mapped 30 m to the east.</p> <p>By 1990, an industrial park had been established 620 m to the west, on the former sites of the lead works, concrete plant, helical gear works, and printing works. Land to the north, north-east, and north-west—previously occupied by brick fields, gravel pits, and associated brick works—had become part of Stockley Park, and by 1999, this area had been developed into a golf course.</p> <p>By 2006, the former locations of the gramophone factory, metal works, depots, chemical works, asphalt plant, road reconstruction works, plastic works, and brick works had been redeveloped as the Adler and Wandford Industrial Estates, comprising unspecified works, factories, and warehouses.</p> <p>By 2009, the government offices had been redeveloped and renamed Heathrow Prologis Park. The RAF station site had also been redeveloped by this time and was occupied by residential developments.</p> <p>Thereafter, the surrounding Site are had largely remained consistent with that present to date.</p>
<p>Historical Information Review</p>	<p>According to Historic England (2020), Stockley Park had been quarried for sand and gravel from the underlying Lynch Hill Gravel Member since the 1800s. Beginning in 1912, refuse was transported from London via the Grand Union Canal to fill the voids left by excavation. As a result, the area now known as Stockley Park was used as a landfill throughout much of the 20th century. Landfilling ceased in 1984, after which a remediation project was initiated.</p> <p>According to UK Development Case Studies (2001), Arup Associates created a master plan for Stockley Park which involved moving more than 4 million cubic metres of landfill from the south of the park to the north, creating the landscape of the golf course. Thereafter, gravels from the eastern part of</p>

	the park were used to create a building platform for the business park undertaken between 1984 and 1987. It was noted as being the largest earthworks project Europe had ever seen at the time. Further remedial actions were undertaken, such as, a complex system of clay buffers and drainage pipes diverts polluted groundwater from the site so that it can be properly treated, and methane produced on site is collected and burned off.
--	---

2.3 Regulatory Database Information

The following Regulatory database information is provided within the Envirocheck ® Report (379502316_1_1) and reproduced as Appendix III.

2.3.1 On-Site Records

The Site is noted as being located within a **BGS Recorded Mineral Site** relating to the former Stockley Gravel & Ballast Pits within the Lynch Hill Gravel Member. Furthermore, the Site is located within an area of **Potentially Infilled Land (Non-Water)** relating to the potential infilling of the former Stockley Gravel & Ballast Pits.

Five (5 no.) **Contemporary Trade Directory Entries** are recorded on-Site with one noted to be active relating to a soft drinks company. The inactive entries related to; Celgene (Pharmaceutical Manufacturers & Distributors) and Toys, Games & Sporting Goods - Manufacturers.

The Site is noted as being located within the London Borough of Hillingdon's **Area of Adopted Greenbelt**, as well as being located within the Colne And Guc (From Confluence With Chess To Ash) **Nitrate Vulnerable Zone**.

No other records are listed on the regulatory data for the Site.

2.3.2 Off-Site records

Pertinent off-Site records within 500 m are summarised as follows:

- ▽ Seven (7 no.) **Discharge Consents** located between 255 m south and 495 m south-east into the Grand Union Canal for the discharge of surface water and trade cooling water;
- ▽ One (1 no.) **Integrated Pollution Prevention And Control** located 380 m south, relating to Greencore Food To Go Limited for 'MCP' (Activity Code: AR01);
- ▽ Two (2 no.) **Local Authority Pollution Prevention and Controls** located 290 and 345 m south, relating to Hanson Aggregates West Drayton for Local Authority Air Pollution Control 'PG3/1 Blending, packing, loading and use of bulk cement' and 'PG3/15 Mineral drying and roadstone coating processes';
- ▽ Ten (10 no.) **Pollution Incidents to Controlled Waters** located between 22 m north-west and 500 m south-east relating to Category 2 and 3 minor and significant incidents of oils and unknown sewage;
- ▽ One (1 no.) **BGS Recorded Landfill Sites** located 120 m north-west of the Site named Stockley Road Tip;
- ▽ Four (4 no.) **Historical Landfill Sites** located 30 m north, 120 m north-west, 230 m west and 400 m north, relating to Stockley Park (SP) East, SP West, Stockley Trident and SP land parcel 2,3,4,5,9. The accepted waste included included Inert, Industrial, Commercial, Household, Special Waste and Liquid Sludge;
- ▽ One (1 no.) **Licensed Waste Management Facilities - Boundaries** and two (2 no.) **Locations**. The boundaries relate to SP Land Parcels 2-5 & 9 located 400 m north, for

Landfills Taking Other Wastes (Construction, Demolition, Dredgings) and was noted to be inactive. The locations related to West Drayton Aggregates and Stockley Pines Golf Course 275 m south and 290 m north, respectively;

- ▽ Seven (7 no.) **Potentially Infilled Land (Non-Water)** located between 30 m north and 430 m east, relating to Unknown Filled Ground (Pit, quarry etc);
- ▽ Four (4 no.) **Potentially Infilled Land (Water)** located between 40 m south-west and 390 m north relating to Unknown Filled Ground (Pond, marsh, river, stream, dock etc);
- ▽ Five (5 no.) **Registered Landfill Sites** located between 200 m west and 440 m north;
 - SP Trident Site - The licence, issued on 1st August 1990 and now lapsed or cancelled. The site falls under the landfill category and was permitted a very large maximum input rate (equal to or greater than 250,000 tonnes per year). Authorised waste includes L.W.R.A. Category A - inert wastes and materials as per the 1988 Collection/Disposal Regulations. Prohibited wastes include glass, pottery, China, enamel, ceramic, mica, asbestos, putrescible waste, silica, and special wastes;
 - SP East - The licence, issued on 1st May 1985 and now lapsed or cancelled. Categorized as a landfill, the site had a very large permitted input rate (equal to or greater than 250,000 tonnes per year). Authorised wastes included asbestos from on-site excavation, domestic, commercial, and industrial waste from nominated excavation sites, and inert waste from construction/industrial sources. Prohibited wastes included clinical waste and special wastes not otherwise specified;
 - Goulds Green Road / SP West - Two licences relating to the same location, issued on 1st May 1979 and 1st June 1987 and now lapsed or cancelled. Classified as a landfill sites with a very large input capacity (250,000 tonnes or more per year). Authorised waste included asbestos from excavation, and previously deposited household, commercial, and industrial waste from Phase 3, with onsite disposal, Asbestos, Civic Amenity/Refuse Amenity Waste, Commercial Waste, Construction And Demolition Wastes Ind. Non-Haz. Inert, Non-Flammable, Ind. Non-Haz. Potentially Combustible, Iron Compounds, Paint Waste Water (Contaminated) Prohibited wastes included sewage sludge, clinical waste, notifiable wastes not otherwise specified, and special wastes not otherwise specified; and
 - SP Land Parcels 2/3/4/5 - The license issued on 5th October 1992 and now lapsed or cancelled. Categorized as a landfill, the site had a very large permitted input rate (equal to or greater than 250,000 tonnes per year). Authorised waste includes L.W.R.A. Category A - inert wastes and materials and sewage sludge. Prohibited wastes included clinical waste and special wastes not otherwise specified.
- ▽ One (1 no.) **Registered Waste Treatment or Disposal Sites** located 420 m south and issued on 1st October 1977 for a Medium input rate (Equal to or greater than 25,000 and less than 75,000 tonnes per year). The licence is now lapsed. Authorised waste includes commercial waste and Prohibited wastes included notifiable and special waste; and
- ▽ Forty-six (46 no.) **Contemporary Trade Directory Entries** located between 91 m east and 500 m south-west. Fourteen (14 no.) of the entries were noted as being active. The entries include a variety of businesses and services across multiple industries. In

transport and logistics, there are airfreight services, cargo handling services, freight forwarders, road haulage services, and distribution services. Automotive-related services feature prominently, such as used car dealers, car engine tuning and diagnostics, car body repairs, car paint and lacquer suppliers, commercial vehicle servicing and parts, garage services, and tyre dealers. The manufacturing and industrial sector includes cladding suppliers and installers, ready-mixed concrete and mortar providers, coating specialists, confectionery manufacturers, electronic component manufacturers and distributors, glass product manufacturers, medical and printing equipment manufacturers, photographic supplies producers, power transmission equipment suppliers, shop fittings manufacturers, temperature monitoring system manufacturers, and toy and sporting goods manufacturers. Engineering and technical services are represented by general and electronic engineers. In the pharmaceutical and healthcare sector, pharmaceutical manufacturers and distributors appear frequently. The list also features telecommunications equipment and systems providers, gas companies, cleaning and domestic services such as dry cleaners, and air conditioning and refrigeration contractors.

Other records (both potential sources and receptors) are listed, however, are not considered relevant to the Assessment of the Site in the context of the distance from the Site or time lapsed since the record entry date.

2.3.3 Radon

Reference to the Envirocheck report indicates the Site is in a Lower probability radon area (less than 1% of homes are estimated to be at or above the Action Level).

No radon protective measures are necessary in the construction of new developments.

2.3.4 Geo-Hazards

The following Geo-Hazards are listed:

Ground Stability Hazard	Hazard Potential
Collapsible Ground Stability Hazards	Very Low.
Compressible Ground Stability Hazards	No Hazard. Moderate Hazard - 40 m north /120 m north-west, likely relating to landfill.
Ground Dissolution Stability Hazards	No Hazard.
Landslide Ground Stability Hazards	Very Low.
Running Sand Ground Stability Hazards	
Shrinking or Swelling Clay Ground Stability Hazards	No Hazard.

2.3.5 Mining

The Site does not lie within a *Development High Risk Area* as identified by the Coal Authority and as such, a formal Coal Mining Risk Assessment is not considered to be required. Furthermore, the Site is not located in a *Coal Mining Reporting Area* and no further works are considered to be required with respect to coal mining.

However, it should be noted that fourteen (14 no.) **BGS Recorded Mineral Sites** are located within 1.0 km, with one located on-Site. The on-Site entry relates to Stockley Gravel & Ballast Pits for the extraction of the Lynch Hill Gravel Member (River Thames Gravel). The off-Site entries, relate to the opencast and wharf extraction of silt (common clay & shale), sand & gravel and a rail depot for crushed rock, sand and gravel. The two rail depot entries are noted as still being active, located approximately 290 m south at West Drayton Rail Depot.

2.3.6 Part 2A of the Environmental Protection Act 1990

London Borough of Hillingdon Council list their Contaminated Land Register on their environment - contaminated land website (<https://www.hillingdon.gov.uk/contaminated-land>), in accordance with Part 2A of the Environmental Protection Act 1990. The register lists the below Sites as being classified as contaminated land;

- ▽ New Years Green Lane Landfill Site, New Years Green Lane, Harvil Road, Harefield.

The entry is located approximately 7.80 km north of the Site at its closest point and as such is not considered a plausible source of contamination.

London Borough of Hillingdon Council was contacted by EGE on the 18th June 2025 pertaining to any information held by the council relating to contaminated land.

The following response was received from London Borough of Hillingdon Council Environmental Protection Team (Contaminated Land):

- 1. From our land contamination record, we can confirm that, the site is part of a bigger site on a former potential contaminated Land Use identified as Landfills: Landfill which is now partly removed ('clean' inert material) located at Stokley Park (East) for mixed waste between 1950 - 1989 with likely gas risk as well as also within 250m of landfill buffer.*
- 2. [...] The site was used for deposition of mixed waste between 1950 - 1989.*
- 3. Of all the 14 previous planning applications for the site that we have reviewed, only one application has a record of Phase 1 Investigation for Desk Study Report and copy of this is available through our planning website using the link: <https://planning.hillingdon.gov.uk/OcellaWeb/planningSearch>. The relevant planning application is: 37103/APP/2022/3110.*
- 4. We are not aware of any associated pollution incidents on the site but as of 28th September 2005 when the site record was last updated, we can confirm there was an active gas protection measure in place but this was said will be switched off but we can't confirm if this has happened or not.*
- 5. [...] The site has not been listed as a Part IIA Site (as per our website Contaminated Land) or listed as a priority site for contaminated land as part of the Councils contaminated land strategy. However, our land contamination record shows the site to be on a former potential contaminated Land Use identified as Landfills: Landfill which is now partly removed ('clean' inert material) as well as within 250m of landfill buffer. Therefore, any issue of contamination for the site will be address under a planning regime rather than under the Part IIA of the Environmental Protection Act 1990.*

A copy of the correspondence is included as Appendix IV.

2.4 Additional Data Sources

Additional data sources are summarised as follows:

<p>Unexploded Ordnance (UXO) Risk</p>	<p>Based on available online mapping (www.zeticauxo.com) the Site is at a Low risk from UXO.</p> <p>A Stage 1 Preliminary Explosive Ordnance Risk Assessment was obtained and is provided as Appendix V, the findings of which are summarised as follows;</p> <ul style="list-style-type: none"> ▼ <i>Ground Investigation - Explosive Ordnance (EO) poses a Low Risk to ground investigation works; and</i> ▼ <i>Post Ground Investigation Development - There is a potentially elevated likelihood of EO encounter during the proposed works.</i> <p>As such, a Detailed UXO Report is not required for any ground investigation works subsequently undertaken at the Site, however, will be required for post ground investigation development works.</p>
<p>London Borough of Hillingdon Council Planning Records</p>	<p><u>On-Site</u></p> <p>An online search of the London Borough of Hillingdon planning records has identified fourteen (14 no.) planning applications as being located on-Site. The applications dated between 1989 and 2022, relating to; erection of buildings, discharge of conditions, erection of flagpoles, bicycle shelters, signs, lighting etc.</p> <p>One planning application (Reference. 37103/APP/2022/3110, dated October 2022) was for 'Refurbishment of existing office building (Use Class E), extension to form new front entrance with new green roof, replacement of existing facade, and associated landscaping, cycle parking, and ancillary works' and included a Desk Study Report undertaken by Hydrock Consultants Limited (Hydrock, November 2022) which has been reviewed by EGE in Section 2.5 of this Report. The planning application was for the northern half of the Site only and was conditionally approved in August 2024.</p> <p><u>Off-Site</u></p> <p>It is noted that two commercial developments within 250 m of the Site have recently undergone redevelopment as follows:</p> <ul style="list-style-type: none"> ▼ <u>Prologis Park, West London</u> <p>Initial Planning Application Reference: 37977/APP/2017/1634, Dated May 2017 located approximately 245 m west - 'Section 73 application for variation of Conditions 5 (approved drawings), 6 (approved documents), 25 (insertion of mezzanine floors) and 27 (use as data centre) as attached to planning permission ref. 37977/APP/2015/1004 dated 14-12-2015: Hybrid Application for the phased comprehensive redevelopment of the site to provide an overall maximum gross floorspace of 45,000sqm of light industrial uses (Use Class B1c and/or Use Class B2) and/or storage and distribution uses (Use Class B8) and ancillary offices, together with servicing, parking, access roads and open space. Full planning permission is sought for Phase 1 containing 18,900sqm of floorspace in two buildings up to 16.2 metres in height (to ridge), together with associated highways works, open space, hard and soft landscaping, car parking and associated infrastructure. Outline planning permission is sought for Phase 2 for up to 26,100sqm of floorspace with all matters, except for access, reserved for later determination'.</p>

	<p>As part of the development, a number of pertinent Geo-Environmental reports were obtained and have been reviewed in Section 2.5;</p> <ul style="list-style-type: none"> ▼ <u>GSK Site, Stockley Park, Hillingdon</u> <p>Initial Planning Application Reference: 39207/APP/2020/2188, dated July 2020 located approximately 60 m west - <i>'Redevelopment of the site to provide two industrial units providing industrial floorspace (Use Class B1c/B2/B8) and ancillary offices together with associated parking, access arrangements, landscaping and infrastructure'</i>.</p> <p>As part of the development, a number of pertinent Geo-Environmental reports were obtained and have been reviewed in Section 2.5.</p>

2.5.2 Previous Report Review - On-Site

Desk Study Report, by Hydrock Consultants Limited (Hydrock), at 1 Longwalk Road, Stockley Park, Reference: 13724-HYD-XX-XX-RP-GE-1000, Dated December 2022.

A Desk Study Report was undertaken for 1 Longwalk Road, Stockley Park. The site constituted a parcel of land, comprising the northern half of the Site with an area of approximately 1.52 ha.

Context and Purpose

Hydrock was instructed by HTC acting for Royal 1 Longwalk Ltd to undertake a Desk Study Report for 1 Longwalk Road, Stockley Park in December 2022. The aim of the report was to formulate a preliminary Ground Model and an Initial Conceptual Site Model of the site to identify and make a preliminary assessment of any potential geo-environmental and geotechnical risks to the proposed internal refurbishment of the existing office and construction of a new atrium.

Site Description

The site was describes as a two-storey office block, associated car parking and roads. The building was noted to have been located in the east of the Site, constructed in the 1980's.

A smaller single-storey building measuring around 16m by 8m was located to the north of the main office building, possibly used for external storage.

A gas governor was situated to the north east of the main building. An electrical substation was located in the north west of the site, within the car park. Two electric vehicle charging points were situated on the eastern wall of the substation. A waste storage area was located in the centre of the car park, in the western side of the site. During the site walkover it was noted that a car battery had been disposed of behind the bins.

Previous Reports

Hydrock make reference to a previous report undertaken off-Site at 4 Longwalk Road in July 2014 (Evolve. July, 2014. Desk Study and Ground Investigation Report, 4 Longwalk Road, Stockley Park, Uxbridge, Middlesex. Ref. J14110, undertaken for ReAssure).

Limited details of the ground investigation were included within the report; however, it was noted that no evidence of contamination was encountered during the ground investigation.

Desk Study

The desk study and historical review identified the below as potential sources of contamination;

On-Site

- ▽ Imported backfill, associated with the former gravel pits located on the northern boundary of the site, possibly including elevated concentrations of metals, metalloids, asbestos fibres, Asbestos Containing Materials, PAH and petroleum hydrocarbons (S01);
- ▽ PCBs and oils from transformers in the gas and electricity sub-stations on site (S02);
- ▽ Ground gases (carbon dioxide and methane) from organic materials in the Made Ground (S03);
- ▽ Ground gases (carbon dioxide and methane) from organic materials in the historic landfill cells (S04);
- ▽ Hydrocarbon vapours from potential VOC and petroleum hydrocarbon spillages/leaks from vehicles in the car park (S05); and
- ▽ Asbestos within existing buildings (S06).

Off-Site

- ▽ Leachate from historic landfilled waste including household, commercial and industrial wastes located on the northern boundary (S07).
- ▽ Ground gases (carbon dioxide and methane) from organic materials in the backfill to the former landfill, now filled, located 100m north (S08).

Recommendations

The potential for contamination at the site was noted. As such, ground investigation was recommended.

2.5.3 Prologis Park Previous Reports Review - Off-Site

Remediation Method Statement & Options Appraisal, by WSP at Prologis Park West London, Reference: 70004909 RMS Final 02, Dated October 2015

The Prologis Park, West London development is located approximately 245 m west of the Site within an area of Historical opencast quarrying and subsequent landfilling, formerly known as Stockley Trident Landfill. As part of the Prologis Park development, extensive site investigation / remediation was undertaken by others.

WSP was instructed by Prologis UK Ltd to undertake a Remediation Method Statement and Options Appraisal for the site in the context of a commercial end use, comprising up to 45,000 sqm of light industrial uses (Use Class B1c and / or Use Class B2) and / or storage and distribution uses (Use Class B8) and ancillary offices, together with servicing, parking, access roads and open space.

WSP provide a high-level review of the previous reports within their RMS for the site, which is included below for reference.

Previous Report Review:

- ▼ Stockley Park Phase 3 Pre-Development Environmental Site Investigation by Ove Arup and Partners Arup Geotechnics, dated February 1998:

The report was designed to provide a consolidated history of the site and to present the results of the landfill reclamation works conducted between 1989 and 1991. The report was commissioned in order to confirm the suitability of the site for an intended commercial building and landscape design.

- *Prior to the reclamation works, the site comprised a former brick-earth and gravel extraction pit (from late 19th century to 1935) which was subsequently in-filled from 1948 to 1961 with domestic and commercial wastes;*
- *Reclamation works involved the preparation of the eastern half of the site for a commercial use and the western half to be returned to pastoral use. Arup reported that the landfill was removed between 1989 to 1991 and deposited at the north end of the Country Park Golf Course. A clay barrier was constructed to the north and west of the site to act as a barrier preventing ingress of ground gas and groundwater from the Golf Course site. A deep land drain was placed at the 'invert of a gravel filled passive gas vent constructed adjacent to the clay barrier on the golf course side at 29.3 m Ordnance Datum (OD)'. Leachate was pumped under licence to offsite public sewers to prevent leachate entering the site. The barrier extended 150 m along the western boundary to 'provide greater security against ingress of leachate or gas*
- *Arup also recorded that the 'additional section of clay barrier' along the south of the site was constructed at this time*
- *Arup also record that underground features and obstructions were removed and the resulting void was backfilled with approximately 750,000 m³ of 'inert' material. Arup record that the two ponds along the eastern boundary were constructed by providing a one metre thick compacted London Clay layer above the fill. The top 0.4 m of material in the western half of the site was not compacted*

The site investigation undertaken by Arup in December 1997 comprised eight boreholes to the top of the London Clay and 15 trial pits to maximum depth of 3.4 m bgl. Soil samples collected during the investigation were analysed for contaminants of concern and reported 'no widespread or significant contamination of the soil using ICRCCL and Dutch Intervention Values (DIV 1994) as guidelines'.

Arup concluded that the 'inert' fill used in 1989-1991 was 'generally clean' and the groundwater quality was 'generally good' and not causing significant contamination. Concentrations of carbon dioxide and methane were below trigger levels.

- ▼ Stockley Park Phase 3 Geotechnical Interpretative Report by Arup Geotechnics, dated December 2000;

The report assessed two historic ground investigations to provide information for the design of the foundation and infrastructure works associated with the Phase 3 development. Recommendations for the design of the foundations were based on the following information.

- *Site investigation by Wimpey Laboratories in 1982, which identified the presence of landfill materials from 6 to 10 m in thickness comprising domestic refuse on London Clay or thin lenses of sand and gravel all above the London Clay;*
- *Site investigations by Arup in 1991 on the southeast corner of the site recorded re-worked natural ground and construction wastes placed along the western edge of the site between 1965 and 1966*

The Arup report produced in 2000 described a site investigation undertaken between June and August 2000. Works comprised 15 No. boreholes to 40 m bgl and 43 trial pits to a maximum depth of 4.1 m bgl. Made Ground was recorded up to 12 m in thickness overlying London Clay. Gravels were only present in the south western corner. Contamination testing was limited to hydrocarbon species which were identified in one location TP22 and was further delineated.

A number of trial pits were located over the northern clay barrier. The trial pits identified the barrier to have a slope of approximately 1:4 (as opposed to a 1:2 slope design value given in an earlier Arup report (1998)). The gravel trench used to vent landfill gas was covered by a mound of clay soil and no leachate vents were encountered.

▼ Stockley Park Phase 3 Land Quality Report Arup, dated April 2014

The Arup Land Quality Report provided a summary of the site history and ground conditions for potential purchasers. The report included a summary of the earlier Arup reports described above and a site walkover. Arup stated that the site walkover did not reveal significant signs of ground contamination.

An updated Conceptual Site Model and risk assessment was undertaken with potential sources of contamination identified as:

- *Made Ground;*
- *Car-storage (point source contamination);*
- *Road salt storage;*
- *Electrical sub-stations; and*
- *Residual contamination from the remedial works that includes soil containing elevated levels of TPH.*

Arup concluded that the contamination risk was 'generally low assuming some mitigation during development' and recommended further site investigation in advance of proposed groundworks to allow for a contemporary assessment in accordance with current guidelines.

▼ Geo-Environmental Assessment, by WSP at Prologis Park West London, Reference: 70004909_V1.7-Re-Issue, Dated March 2015

The ground investigation was undertaken to assess the following Potential Areas of Concern (POAC): PAOC1 - Imported fill material; PAOC2 - Possible underground tank; PAOC3 - Disused wheel wash facility and former tank; PAOC4 - Void containing refuse/waste; PAOC5 - Electrical sub-station (north west); PAOC6 - Electrical sub-station (south west); PAOC7 - Raised mound; PAOC8 - Raised central building platform; PAOC9 - Gas vents; and PAOC10 - Clay cut off walls assessment.

A summary of the strata encountered during the 2014 investigation is presented below.

- *Made Ground (0.0 - 12.5 m bgl) - Generally described as sandy gravelly CLAY. Gravels included but were not limited to flint, brick, concrete, chalk and clinker. Inclusions of plastic, wood, geotextile, tile, glass and metal;*
- *Kempton Park Gravels (2.5 - 9.0 m bgl) - Predominantly sandy GRAVEL and GRAVEL. Gravels were flint (encountered in extreme west and east of the site only); and*
- *London Clay (3.3 - >15 m bgl) - CLAY with minor inclusions of sand and silt.*

A total of ten potential areas of concern were identified for further investigation. No evidence of notable contamination was recorded in the areas of the former underground tank, vehicle washing bays, previously recorded voids or the former sub-stations.

Soil analytical results have identified the presence of asbestos within the 750,000 cu.m of material imported during the reclamation of the site. The material used to construct the raised platform area and the two discrete mounds were similar in composition to those identified within infilled material across the remainder of the site.

Table 3.1 provides details of the potential sources of contamination and a summary of risk with respect to human health, controlled waters, soil gas in accumulation in structures and ingress of contaminants into potable water supply pipes.

Table 3.1 Sources of identified Contamination and Risk

Source Area	Review of Risk
Fill material imported during the reclamation works c750,000 cu.m	Soil chemical contaminant concentrations were below the relevant assessment criteria and therefore are not considered to pose a human health exposure risk. Within the development footprint, Asbestos Containing Material (ACM) was detected in approximately 20% of soil samples tested across the entire Site at all depths.

Source Area	Review of Risk
	<p>Asbestos Containing Material (ACM) was also identified within the majority of the soil samples located in the landscaped areas within the upper 1 m.</p> <p>Elevated concentrations of Ammonium were detected throughout the groundwater at the Site. No distinguishable contaminant gradient was identified. Ammonium concentrations in soil leachate were also elevated in unsaturated soil across the site.</p> <p>Contaminants that may pose a risk to potable water supply pipes were not identified.</p> <p>Elevated concentrations of CO₂ were identified in two borehole locations only.</p>
Retained Landscaped Areas	<p>Asbestos Containing Material (ACM) was identified within the majority of the soil samples located in the landscaped areas within the upper 1 m.</p> <p>Contaminants that may pose a risk to potable water supply pipes were not identified.</p>
Possible underground storage tank	No underground storage tanks were identified and no evidence of historical contamination was identified within the surrounding area.
Disused wheel wash facility	No evidence of soil contamination was identified within this area.
Void containing refuse/waste	No evidence of soil contamination was identified within this area.
Electrical sub-stations (north west and south west of site)	A slightly elevated concentration of PCB contamination was identified within the vicinity of the electrical sub-station within the north west section of the site. However, the exceedance was marginal, and is considered not to require further assessment or remedial works.
Fill material within raised mounds	The soils identified within these mounds were similar in composition to those identified within the remainder of the Site. No evidence of soil contamination was identified within this area.
Fill materials used to create the raised central building platform	The soils identified within the mounds were similar in composition to those identified within the remainder of the Site. No evidence of soil contamination was identified within this area.
Off-site leachate and gas from the adjacent landfill	<p>Restrictions were imposed within the immediate vicinity of the Clay Barrier and thus ground investigation information in these areas is limited.</p> <p>However, soil, groundwater and soil gas concentrations are low in the exploratory hole closest to the Clay Barriers. Thus no direct evidence was obtained to suggest the Clay Barriers have been compromised.</p>

The ACM present within fill materials was not considered to represent a risk to the commercial end use due to capping of the buildings and hardstanding. However, appropriate precautions were required for construction workers.

Only a limited number of trial pits were excavated within the landscaped areas on the western and southern boundaries of the site due to a 40 m exclusion zone imposed by Stockley Park Phase 3 Ltd and remained an area of potential uncertainty with respect to asbestos contamination.

Asbestos Containing Material (ACM) was identified within the majority of the soil samples located in the landscaped areas within the upper 1 m. The landscaped areas are covered in retained trees and approximately 12,000 m² of open grassed areas. This area was subjected to further assessment.

An intrusive site investigation was completed by HGEL and overseen by WSP along the western and southern boundaries of the site on the 18th and 19th February 2015 in order to characterise the asbestos in soil contaminant risk. The works involved the excavation of 34 No. hand dug pits to maximum depth of 1.0 m bgl and collection of soil samples for chemical analysis. In all locations Made Ground was identified and generally comprised a topsoil of gravelly silty sand, over gravelly sandy clay. The gravel

component commonly recorded flint, concrete, brick, charcoal, glass, ceramics, metal and clinker as being present. A total of 37 No. soil samples were analysed for the presence of asbestos containing material, including a suspected fragment of bound asbestos cement. 18 No. soil samples were found to contain asbestos fibres, of which 12 No. recorded concentrations at < 0.001% w/w. The maximum recorded soil concentration was 0.005% (w/w) crocidolite in HP110 at 0.9 m bgl.

Suspected cement bound asbestos recorded at HP115 0.5 m bgl was confirmed to be cement bound asbestos (Chrysotile) upon laboratory identification.

It was noted that asbestos fibres were not detected in the corresponding soil sample at HP115 where the piece of cement bound asbestos was identified.

No visual or olfactory evidence of organic contamination was noted during the investigation.

It was noted that the groundwater beneath the site was impacted by ammonium and based on the previous reports and ground investigations, the following conclusions were drawn;

- *Leaching of unsaturated soils at the site is potentially adding to the concentration of ammonium in underlying groundwater, however, it is unlikely to be the sole source;*
- *The River Terrace Deposits in the surrounding area of the site have been extensively quarried/reworked and backfilled with Made Ground and landfill materials and is likely to provide additional external sources of ammonium;*
- *No designated aquifer unit is considered to be present which would represent a potential receptor (due to extensive gravel extraction);*
- *Based on the data obtained from the level loggers, the Grand Union Canal is not in hydraulic connection with the groundwater underlying the site and is not deemed to be at risk; and*
- *The presence of the Clay Barriers and the cohesive nature of the soils have retarded groundwater flow under the site and may have led to anoxic conditions naturally increasing the ammonium levels in groundwater at the site.*

Based on the above, it was considered that groundwater conditions do not present a material risk to surrounding controlled water receptors and further remedial works are not likely to result in improved groundwater conditions. Future redevelopment will effectively cap the site and reduce surface infiltration, removing ongoing leaching potential from the unsaturated soils. It should however be borne in mind that site conditions may remain conducive to natural generation of ammoniacal nitrogen following the redevelopment of the site.

Further confirmatory groundwater monitoring were recommended to support the redevelopment works.

Four rounds of ground gas monitoring were undertaken. The majority of monitoring results do not provide a gas screening value (GSV) that would suggest gas protection measures are required. However, based on elevated CO₂ readings (>5% v/v) in two locations, namely BH07 and BH10S and the presence of substantial depths of fill material, it is considered prudent that the site is classified as Characteristic Situation 2 - Low Risk according to the CIRIA Ground Gas Risk Assessment Scheme (CIRIA C665).

Gas protection measures for office areas should be incorporated into the redevelopment design.

Previous Remedial Works Review

▼ *Stockley Park Phase 3 (Dawleywood) Remediation Report by Arup, dated May 2001;*

Arup was commissioned to co-ordinate, supervise and subsequent intrusive investigations and subsequent remediation works of areas of contamination identified pre-2000.

The ground remediation works were designed to remove hydrocarbon contamination, asbestos-cement board and underground structures.

Arup described an area of hydrocarbon contamination that was identified in the southeastern portion of the site during excavation work for land drains.

The hydrocarbon contamination was subsequently delineated in November 2000. Seven areas were identified, namely Area 1 and 2 (hydrocarbon contamination); Area 3 (UST); two hydrocarbon hotspots (Areas 4 and 7); and two underground concrete interceptor tanks (Areas 5 and 6).

Remedial target concentrations of 1,000 mg/kg for polycyclic aromatic hydrocarbons (PAH); 1,000 mg/kg for mineral oils / total petroleum hydrocarbons (TPH); 50 ppm for field based photo ionisation detector (PID) readings; and

Arup state that 'dig and dump' was the preferred remediation option, with overburden removed and stockpiled onsite. Contaminated material and underground structures were removed to a licensed landfill (Norlands Lane Landfill, Egham Surrey). Verification was based on visual, olfactory and PID measurements to initially delineate the extent of material removal, with the collection of side wall and base samples for validation testing. Two samples that exceeded remediation validation criteria were left in-situ, on the basis that they were considered to be representative of 'tarmac' and TPH and PAH compounds were identified in a bound form that did not pose a risk to human health receptors.

Arup recorded a total of 9,620 tonnes of mainly hydrocarbon impacted soil was excavated and removed from site. The contamination was generally encountered at a depth of 0.5 m bgl and extended to maximum depth of 2.4 m bgl. Arup recorded that the voids were backfilled with 'suitable material' from site won and offsite sources.

In total, 36,000 litres of potentially contaminated groundwater was removed from Area 1 and deposited at the Thames Waste Management Camberley Treatment Plant. Liquid contained in the below ground tank was recorded as being disposed offsite as special waste. Arup record that within an earth bank along the southern boundary, a layer of hydrocarbon impacted material was identified between approximately 1.8 m and 2.1 m bgl. Soil samples were collected and recorded hydrocarbon levels between < 10 mg/kg and 2,300 mg/kg. No further remedial works were proposed in that area.

Conceptual Site Model

The following relevant pollutant linkages were included within Table 4.1 and noted as requiring remedial action;

Table 4-1 Relevant Pollutant Linkages that Require Remedial Action

Relevant Linkage	Pollutant	Source	Pathway	Receptor	Assessment
RPL1		Asbestos Containing Material in Landscaped Areas within the Western and Southern section of the Site	Ingestion and Inhalation of contaminated soils and dusts generated from areas that are not covered by hardstand or other surface coverings. Inhalation of dusts from areas that are not covered by hardstand or other surface coverings.	Female Adult Worker (Age Class AC17)	High – Potential for ACM impacted soils in exposed areas to pose a risk to Human Health.
RPL2		Carbon Dioxide generated from Made Ground	Inhalation of gas concentrations released from underlying Made Ground and building up in on-site structures to potentially asphyxiation limits.	Future Site Occupants	Low to Medium – Concentrations of Carbon dioxide have been identified across the site to exceed the 5.0% v/v trigger threshold requiring gas protection measures.
RPL3		Previously unidentified contamination within Landscaped Areas and within Topsoil to be re-used across the Site	Direct Contact and Ingestion with areas not covered with hardstanding.	Female Adult Worker (Age Class AC17)	Low to Medium – Potential for ingestion & direct contact with previously unidentified contamination
RPL4		Residual contamination within the shallow Made Ground	Ingress of contamination through the walls of water supply pipes	Potable water supply for the Site	Low – Potential for TPH and Phenol ingress into potable water supply

Site Specific Remediation Strategy

Following a remediation options, constraints and appraisal, WSP outlined the Site-Specific Remediation Strategy;

- ▼ *RPL1: Centred on the respective exploratory location(s), the preferred remediation technology is for the excavation and removal ACM impacted material and emplacement under Buildings or Hardstanding.*

The resultant voids will be back filled with a material that is chemically validated as suitable for use i.e. protective of human health, controlled waters and the wider environment.

Alternatively should the Site formation level allow placement of a capillary break and Marker Layer (Orange Terram or similar) over the hotspots and placement on 600 mm of 'clean' imported soil is acceptable.

- ▼ *RPL2: The concentrations of carbon dioxide generated from underlying Made Ground pose a potential asphyxiation risk within the offices associated with each unit. concentrations. The Site has been classified as Gas Characteristic Situation 2, in accordance with CIRIA C665. As such a gas resistance membrane is will be required within office areas.*

On this basis it is recommended that a 1200 g/DPM membrane is installed in accordance with BRE212/BRE414 in office areas. These measures should be confirmed with the Local Authority Building Control Officer in advance of construction.

- ▼ *RPL3: There is a potential for previously unidentified contamination to be encountered during the earthworks and piling operations on Site. A WSP Engineer will be on site*

during the earthworks and piling operations. Should visually or olfactory impacted material be encountered, excavation will be required, with the subsequent side walls and base of the excavation validated.

WSP will agree suitable remedial approach with the Local Authority.

The excavated material will be subject to complex sorting on Site under supervision and direction of WSP allowing for streams of material to be generated, comprising potentially suitable for re-use and material for disposal from site. The characterisation of material will be based on visual and olfactory evidence.

Material deemed unsuitable to be retained of Site will be removed to a suitably licenced facility. Remaining material will be re-used on Site following suitable chemical analysis.

The resultant voids will be backfilled with a material that is chemically validated as suitable for use i.e. protective of human health, controlled waters and the wider environment.

- ▽ *RPL4: At this stage and on the basis that locations of service utilities are not finalised it is recommended that suitable protection should be provide to the water supply from petroleum hydrocarbons and phenol*

Validation Reporting

Finally, these remedial works would be verified within a validation report, including as a minimum the following details;

- ▽ A summary of the information contained in the risk assessment reports along with the agreed redevelopment strategy and objectives;
- ▽ Details of all parties involved in the works;
- ▽ Laboratory validation test certificates;
- ▽ Details and quantities of excavated soils and soils re-used on site or disposed of off - site;
- ▽ Details of the validation data for imported soils if used on-site (at least three sets of analysis per source plus additional samples one every 100 m3 for areas of soft landscaping and one every 500 m3 under hardstanding);
- ▽ Records of all earthworks, excavations and sorting including as built drawings, photographs, quantities of materials; and
- ▽ Waste classification and management documentation.

Remediation Validation Report, by WSP at Prologis Park West London, Reference: 70004909 VAL, Dated December 2016

WSP / Parsons Brinckerhoff were instructed by Prologis UK Limited to undertake a validation report for the site in line with the Remediation Method Statement and Options Appraisal Report previously undertaken.

Verification Works

It was concluded that the site had been appropriately remediated as per the Remediation Method Statement and Options Appraisal Report;

- ▽ *WSP / Parsons Brinckerhoff attended site on 10 No. occasions during the earthworks to view the excavated material and supervise and validate the hotspots excavations;*

- ▽ *Areas of known contamination were excavated according to the specification provided in the RMS, validated and a suitable cover layer comprising a capillary break layer, marker layer and clean site won topsoil placed to ensure no exposure pathway to future site users;*
- ▽ *Previously unidentified contamination was encountered during the ground works along the Canal in the East of the Site. Visible fragments of asbestos sheeting were picked and a capillary break layer, marker layer and capping material placed to break the exposure pathway;*
- ▽ *Suitable Gas protection Measures appropriate to CS2 classification have been installed within the structures associated with the Phase 1 Development; and,*
- ▽ *Adequate protection of potable water supply has been provided through the installation of a barrier pipe mitigating the risk of any permeation from contamination within the Made Ground.*

Finally, it was noted that RPL2 and RPL4 were still outstanding for Phase 2 of the development and the validation of the gas protection membrane and installed potable water pipes would be covered under a separate report.

Ground Gas Remediation Strategy by Delta-Simons Environmental Consultants Limited at Prologis Park, West London, Reference: 18-0443.01 Dated April 2018

Delta-Simons Environmental Consultants Limited, undertook a Ground Gas Remediation Strategy Report for Prologis Park, West London to support the development of the site and the discharge of planning conditions.

Remediation Requirements

It was found that specific ground gas protection measures were not deemed necessary in the main warehouse due to the large size of the proposed warehouse (circa 76,180 sq.ft in Unit 3A and 58,830 sq.ft in Unit 3B), suspended cast in-situ floor slabs, adoption of 1200-gauge membrane and ventilation from warehouse doors / openings.

The ground gas protection measures were to be installed in accordance with BS 8485:2015 and should score 2.5 points as per Table 4 (CS2/ Type D building with Type C enclosed spaces).

Ground gas remedial measures within the proposed light industrial / commercial development within enclosed ground floor spaces were required to comprise:

- ▽ A gas resistant membrane beneath enclosed ground floor spaces (e.g. offices) of the proposed development, installed beneath the suspended floor slab of the proposed development, meeting the requirements of Table 7 of BS 8485:2015 (2 pt); and
- ▽ Reinforced cast in-situ suspended floor slab, with minimal penetrations (1.5 pts).

Verification Requirements

It was recommended that the design, installation and verification of the gas protection measures is carried out by a suitably qualified and experienced specialist, independent of the Contractor.

Engineer's drawings confirming the inclusion of gas protection measures were to be provided to the Environmental Consultant for inclusion within the Verification Report.

The Contractor was required to provide verification certification / integrity testing as outlined in BS 8485:2015 and photographs of the installed gas protection measures, copies of which should be provided to the Environmental Consultant for inclusion within the Verification Report.

EGE Comments

While EGE has not been able to obtain the final verification report for Prologis Park West London, it is assumed that all remedial requirements were met as the site has been fully developed and is operational.

2.5.3 GSK Site, Stockley Park Previous Reports Review - Off-Site

GSK Site, Stockley Park, Hillingdon, Geo-environmental - Preliminary Risk Assessment, by WSP, dated June 2020, ref 70062215-PRA

WSP undertook a Geo-environmental - Preliminary Risk Assessment for a parcel of land located approximately 60 m west of the Site, comprising an area of approximately 6.3 ha. It is noted that the site is located within the Stockley Park historic quarrying / landfilling and subsequent remediation works as outlined by the Historic England Entry (2020).

Context and Setting

WSP was instructed by Prologis UK to undertake a Geo-Environmental Phase 1 Preliminary Risk Assessment at GSK Site, Stockley Park, Hillingdon to support the redevelopment of site to comprise two industrial units providing industrial floorspace (Uses Class B1c/B2/B8) and ancillary officers together with associated parking, access arrangements, landscaping and infrastructure.

Site Description

A site walkover was undertaken in February 2019 and was found to comprise the GSK offices, including four office buildings, car parking and soft landscaping. Two ponds were noted to be located adjacent to the eastern building line of the most northern GSK building and the second is located next to the central eastern Site boundary.

It was noted that the site was in use for pharmaceutical manufacture and distribution.

Three electrical sub-stations were located on-site.

Three 30,000 litres underground storage tanks (USTs) were noted on-site one associated with each building to power back-up generators (located on the roofs). The fill points are located adjacent to the USTs. Reportedly installed in the early 1990s and decommissioned in 2014, which comprised emptying the tanks of fuel and filling them with foam. Each backup generator was served by a dedicated above ground tank (AGTs), approximately 500 litres in capacity. Reportedly the day tanks were emptied at the same time as the USTs were decommissioned.

Desk Study Key Findings

As part of the PRA report, WSP reviewed the below report undertaken by Ramboll Environmental, with key comments included below for reference;

- ▽ 1-3 Iron Bridge Road, Stockley Park, Uxbridge, Middlesex, Phase 1 Environmental Review, by Ramboll Environmental, ref UK11-22552, dated 15 February 2016.

The Ramboll Environ report indicates that in 2007, one of the fuel tanks (associated with building B10) was identified to be leaking resulting in impact to the surrounding soil. The tank and the surrounding soils were removed and a new tank and 'clean' soil installed. No documentation regarding the works was available for review by WSP.

Low to moderate risk of on-site migration of contamination from off-site sources. The potential for on-site migration of leachate and gas from landfill in the wider surrounds considered largely mitigated by the leachate collection systems installed to the north of Horton Road. Thames Water concluded leachate to be of sufficient quality to no longer require monitoring for disposal to its treatment works and that Hillingdon Council agreed as of 2014 that no further gas monitoring was required on the wider Stockley Park area; and Low to moderate potential for contamination on Site on basis of reported earthworks during construction.

The following potential sources of contamination were identified by WSP;

On-site:

- ▽ Historical Landfilling - Possibly site wide, although it was noted in the Ramboll Environmental Desk Study that the landfill beneath the three buildings on site has been removed and replaced with engineered stone to support building foundations;
- ▽ USTs and historical leaks;
- ▽ Historical Piggery - Northern half of site; and
- ▽ Made Ground associated with former buildings / development - Southern half of site.

Off-Site:

- ▽ Landfill - North and west (confirmed landfills), also areas of infilling to the west;
- ▽ Current and historical industrial activities - South and east

The Risk to human health was found to be 'low to moderate', risk to controlled waters found to be 'low' and risk to buildings and services found to be 'low' in the context of the commercial development and geo-environmental ground investigation was recommended.

GSK Site, Stockley Park, Hillingdon, Phase 2 Geo-environmental and Geotechnical Assessment, by WSP, dated June 2020, ref 70062215-P2

WSP undertook a Phase 2 Geo-environmental and Geotechnical Assessment for a parcel of land located approximately 60 m west of the Site, comprising an area of approximately 6.3 ha. It is noted that the site is located within the Stockley Park historic quarrying / landfilling and subsequent remediation works as outlined by the Historic England Entry (2020).

Context and Purpose

WSP was instructed by Prologis UK to undertake a Phase 2 Geo-environmental and Geotechnical Assessment at GSK Site, Stockley Park, Hillingdon to support the redevelopment of site to comprise two industrial units providing industrial floorspace (Use Class B1c/B2/B8) and ancillary officers together with associated parking, access arrangements, landscaping and infrastructure.

Site Description

No significant changes were made from the site walkover described in the PRA report.

Site Investigation and Summary of Findings

The Site investigations consisted of the following:

- ▽ Ground investigation carried out between 23 February and 10 March 2019;
- ▽ Installation of 50 mm diameter gas and groundwater monitoring wells in 14 locations;

- ▽ Four rounds of gas and groundwater level monitoring including two rounds of groundwater and surface water sampling;
- ▽ Chemical laboratory analysis of recovered soil, groundwater and surface water samples;
- ▽ Collection of soil samples for geotechnical laboratory testing

The key findings of the Site Investigation were as follows:

- ▽ The ground conditions encountered across the site were generally consistent with Council records and BGS geological maps for the area. The surface comprised block paving, underlain by an average of 0.31 m of granular subbase consisting of sand over limestone, a black geotextile membrane was observed in the majority of exploratory locations between the subbase and the underlying Made Ground.

Made Ground was present throughout the Site and was underlain by reworked natural clay in eight exploratory holes. Where the full depth of the Made Ground was proven, the Lynch Hill Gravel Member was encountered in six locations, with an average thickness of 0.70 m. Langley Silt, in line with BGS mapping, was recorded in two locations in the southeast and two in the west, averaging 0.61 m in thickness.

Groundwater was observed during the investigation as seepages or strikes within the Made Ground at seven locations, and at the top of the London Clay Formation in WS01. Groundwater monitoring subsequently identified water in 12 locations, with nine providing sufficient yield for sampling. A general southerly flow direction toward the Grand Union Canal was inferred; however, the data were inconclusive regarding the presence of a hydraulically continuous groundwater body beneath the Site. The cohesive nature of the Made Ground and the existence of a sheet pile wall along the canal likely limited lateral groundwater movement. These findings reflected similar conditions recorded at the adjacent Prologis Park: West London site, where a hydraulic disconnection from the canal had been demonstrated.

One monitoring installation placed within the limited extent of the Lynch Hill Gravel Member did record groundwater. Although most of this aquifer unit had been removed from the Site, its designation as a Principal Aquifer warranted further risk assessment, which was addressed in Section 4.

- ▽ Three instances of visual and olfactory evidence of contamination were identified during the site investigation;
 - Strong hydrocarbon odour at 4.00 m bgl within the Lynch Hill Gravel Member in BH02;
 - Black leachate recorded between 3.00 m and 4.00 m bgl within Made Ground in WS04; and
 - Strong hydrocarbon odour and black staining between 2.40 m and 2.75 m bgl within the Made Ground in WS06.
- ▽ Two exceedances of the lead commercial GAC were recorded in Made Ground samples and asbestos was detected in three Made Ground soil samples. However, the risk of exposure to current and future Site users is considered to be low given the widespread presence of hardstanding in the proposed development;
- ▽ A summary of exceedances for leachate and groundwater results, when compared to the relevant GACs, is provided in Table 13 and Table 14, respectively.

Table 13 – Exceedances of UK DWS / WHO Guidelines in Soil Leachate Samples

Analyte	Maximum Concentration (µg/l)	DWS / WHO (µg/l)	No > DWS / WHO	Remarks
pH	10.97	10	1	Exceedance in WS02 at 1.00 m bgl (Made Ground).
Ammoniacal Nitrogen as NH ₄	28,800*	500	4	Greatest concentration recorded in WS04 at 2.00 m bgl (Made Ground).
TPH Aromatic C10-C12	133	90	1	Exceedance in WS06 at 2.50 m bgl (Made Ground).
Benzo(a)pyrene]	0.0189	0.01	3	Exceedances in WS02 at 1.00 m bgl, WS04 at 2.00 m bgl and WS06 at 2.50 m bgl (Made Ground).

*Ammoniacal nitrogen concentrations converted based on pH and temperature where appropriate.

Table 14 – Exceedances of UK DWS / WHO Guidelines in Groundwater Samples

Analyte	Maximum Concentration (µg/l)	DWS / WHO (µg/l)	No > DWS / WHO	Remarks
Ammoniacal Nitrogen as NH ₄	60,600*	500	18	Maximum concentrations recorded in WS04.
Arsenic	19.8	10	3	Exceedances in BH01 in both monitoring rounds and WS11 in round 1 only.
Boron	1,230	1,000	1	Exceedance in WS04 in round 1.
Barium	1,260	700	1	Exceedance in WS04 in round 1.
Nickel	38.4	20	2	Exceedances in WS08 in both monitoring rounds.
TPH Aromatic C16-C21	121	90	1	Exceedance in WS04 in round 1.
TPH Aromatic C21-C35	445	90	1	Exceedance in WS04 in round 1.
Benzo(a)pyrene	15.2	0.01	6	Maximum concentrations in WS04
Sum of four PAHs**	47.94	0.1	3	Exceedance in WS04 in both rounds and BH01 in round 2.

∇ The exceedances were found to represent a low risk to the underlying Principal Aquifer in the context of the site setting and historical context of the site.

- ▽ The risk from identified relevant GAC exceedances to surface water GACs from soil leachate and groundwater samples were assessed to be low in the context of the site setting, historical context and sheet piling of the Grand Union Canal. Furthermore, upstream gradient samples were typically found to be higher than the downstream gradient samples;
- ▽ Following the four rounds of ground gas monitoring, a maximum flow rate of 0.1 l/hr, a maximum carbon dioxide concentration of 13.80% v/v and a maximum methane concentration of 7.8% v/v, were recorded. As such, a Characteristic Situation 2 (Low Risk) was recommended with associated gas protection measures, although two further rounds of monitoring were recommended to be undertaken;
- ▽ PID readings during the ground gas monitoring was typically recorded as <0.1 ppm however a maximum concentration for 22.6 ppm was recorded. The risk posed from hydrocarbon odours on-site was considered to be low;

Recommendations

- ▽ *Additional ground investigation and subsequent monitoring beneath the footprint of existing buildings following demolition;*
- ▽ *The ancillary fuel pipes are decommissioned (unless previously completed at the time of reported UST decommissioning) and the USTs and pipes removed, along with the excavation of visually and olfactory contaminated material and validation sampling;*
- ▽ *Installation of ground gas protection measures in new buildings;*
- ▽ *Provision of a capping layer (minimum 300 mm thick) in areas of soft landscaping;*
- ▽ *Completion of a potable water pipe assessment where pipes are to be laid within Made Ground materials once the development layout has been finalised; and,*
- ▽ *Production of a Remediation Strategy (RS) detailing the above remediation requirements.*

Remediation Strategy, by WSP, at GSK Site, Stockley Park, Hillingdon, Reference: 70077417-REM, Dated July 2021;

WSP undertook a Remediation Strategy for a parcel of land located approximately 60 m west of the Site, comprising an area of approximately 6.3 ha. It is noted that the site is located within the Stockley Park historic quarrying / landfilling and subsequent remediation works as outlined by the Historic England Entry (2020).

Context and Purpose

WSP was instructed by Prologis UK to undertake a Remediation Strategy at GSK Site, Stockley Park, Hillingdon to support the redevelopment of site to comprise two industrial units providing industrial floorspace (Use Class B1c/B2/B8) and ancillary officers together with associated parking, access arrangements, landscaping and infrastructure.

Three previous reports were mentioned as sources of information for the remediation strategy (PRA 2019, P2 GEA, 2019 and GQRA, 2021) but were not publicly available through Borough of Hillingdon planning portal.

Summary of Remedial Objective (Per Relevant Pollutant Linkage (RPL)):

- ▽ RCL1: Free Asbestos Fibres in Soil

This related to the protection of construction workers, future site users, and adjacent land users. During excavation (particularly drainage works), control measures were recommended including source removal of arisings, appropriate PPE/RPE, and air monitoring. A pathway break in soft landscaped areas was also advised to limit exposure risks.

▼ RCL2: Metals in Made Ground Soils

Control measures were required in line with CDM Regulations during localised earthworks and other infrastructure installations. These measures aimed to protect site workers and future users, with pathway breaks in soft landscaped zones recommended to interrupt contaminant migration.

▼ RCL3: Hydrocarbons (linked to 3 USTs and other on-site hotspots)

CDM-compliant control measures were to be applied during excavation. Decommissioning and removal of USTs was to be carried out following good practice, overseen by a suitably qualified person. Excavated contaminated soils required validation and possible off-site treatment or disposal. These works were recommended during demolition or earthworks phases.

▼ RCL4: Soil Gases from Made Ground and Infilled Material (on/off-site)

To protect both current and future users, especially within new structures, gas protection measures were advised. These included controls to prevent gas migration and the recommendation for further ground gas and vapour monitoring to confirm the need for protection systems.

▼ RCL5: Aggressive Contaminants (e.g., sulphates, hydrocarbons)

To safeguard below-ground construction materials such as concrete and drainage systems, an assessment of concrete durability in aggressive ground conditions was recommended. The potential need for barrier pipe systems was to be considered, subject to statutory authority agreement.

In addition to the above measures, a hotspot protocol was implemented in the event that any unexpected contamination be encountered during the development.

Remediation Implementation Plan, By Crossfield Consulting, at Stockley Park, Iron Bridge Road N, West Drayton, Reference: CCL03466.CO23, Dated September 2021

It is understood that Winvic Construction Limited were awarded the construction contract of the proposed development.

Crossfield Consulting Limited was commissioned, by Winvic Construction Limited, to prepare a Remediation Implementation Plan to detail how the remediation works that were identified by WSP will be undertaken and including details of how the works will be verified so that a Remediation Verification Report could subsequently be prepared.

While no verification report was available for review on the Borough of Hillingdon planning portal at the time of writing this Report.

3.0 Preliminary Conceptual Site Model (CSM)

A Conceptual Site Model (CSM) represents the relationships between contaminant sources, pathways and receptors, to support the identification and assessment of Potential Contaminant Linkages (PCL).

3.1 Potential Sources of Contamination

On-Site

- ▼ Relict contamination from historical opencast quarrying and subsequent landfilling. Although it is noted that a large scale remediation and removal of landfill beneath the site was undertaken (Historic England (2020) & UK Development Case Studies (2001)) - potential for asbestos, hydrocarbons, PAHs, metals and hazardous ground gas;
- ▼ Potential deep Made Ground associated with the historical development across the Site including the infilling of gravels to create a building platform for the business park (UK Development Case Studies (2001)) - potential for asbestos, hydrocarbons, PAHs, metals and hazardous ground gas;
- ▼ Potential contamination from the electrical sub-stations present - potential for asbestos, hydrocarbons, PAHs, metals and PCBs;
- ▼ Contaminants from the Sites current and historical car park use, including contaminants from minor leaks and spills, from vehicles - potential for metals and hydrocarbons;
- ▼ Potential asbestos within buildings present on-Site; and
- ▼ Potential unrecorded/ un-mapped sources

Off-Site

- ▼ Relict contamination from widespread historical opencast quarrying and subsequent landfilling in the surrounding Site area. Although it is noted that a large-scale remediation and removal of landfill beneath the site was undertaken with landfilled material relocated north and redeveloped in to the golf course (Historic England (2020) & UK Development Case Studies (2001)) - potential for asbestos, hydrocarbons, PAHs, metals and hazardous ground gas;
- ▼ USTs and historical leaks off-Site to the west located within the GSK Site, Stockley Park site - potential for hydrocarbons, PAHs and hazardous ground gas; and
- ▼ Elevated concentrations of soil & groundwater contaminants and hazardous ground gas identified across the Stockley Park site areas to the west as part of third-party investigations - asbestos, hydrocarbons, PAHs, metals and hazardous ground gas.

3.2 Identified Potential Receptors

Relevant potential receptors are considered to include:

- ▼ Construction workers;
- ▼ Third parties during construction (adjacent Site users);
- ▼ Future Site users and maintenance workers;
- ▼ The superficial Lynch Hill Gravel Member - Principal Aquifer (if present, following historical opencast quarrying)

- ▽ The pond located pond located approximately 30 m east from the Site and the Grand Union Canal is located 225 m south.
- ▽ The Built Environment (new buildings and infrastructure / utilities).

The underlying London Clay Formation bedrock is classified as Unproductive Strata by the EA and as such is not considered to be a plausible receptor.

3.3 Potential Pathways

The potential pathways are considered to be as follows:

- ▽ Direct contact, ingestion or inhalation of soil bound contaminants / dust during or following redevelopment;
- ▽ Inhalation of organic vapours associated with contamination;
- ▽ Migration of ground gas / vapours into on-Site buildings causing asphyxiation or risk of explosion;
- ▽ Leaching of contamination into groundwater followed by migration of groundwater to the wider groundwater environment; and
- ▽ Direct contact between aggressive ground conditions and new infrastructure.

Preliminary (Geo-Environmental) Risk Assessment (PRA)

Stockley Park, Uxbridge
EGE-25-06-13-01

Source	Pathway(s)	Receptor(s)	Risk Ratings	Justification & Mitigation (if required)
<p>On-Site</p> <p>Relict contamination from historical opencast quarrying and subsequent landfilling.</p> <p>Deep Made Ground associated with the historical development across the Site including the infilling of gravels to create a building platform.</p> <p>The electrical sub-stations present</p> <p>Car park use - minor leaks and spills, from vehicles</p> <p>Asbestos within buildings.</p> <p>Unrecorded/ un-mapped sources</p> <p>Off-Site</p> <p>Relict contamination from historical opencast quarrying</p>	<p>Direct contact/ ingestion and inhalation of dust, vapours and asbestos fibres.</p>	<p>Future Site users.</p> <p>Groundworkers during the redevelopment or during any sub-surface maintenance works.</p>	<p>Low to Moderate Risk</p>	<p>The potential for significant and widespread soil contamination is considered to be Low to Moderate due to the potential for relict contamination from historical quarrying and subsequent landfilling, however, it is noted that a large scale remediation project was undertaken to create the building platform which the current office buildings are located upon. Other potential sources of contamination on-Site include the potential for deep Made Ground, the electrical sub-stations, car park use, asbestos within buildings and the off-Site potential sources.</p> <p>It is recommended that environmental investigation is undertaken across the Site at the time of any geotechnical assessment to confirm the soil conditions and risk to the identified receptors.</p> <p>A 'hotspot' protocol should be in place during the redevelopment for ground workers to act upon should suspected contamination be identified.</p> <p>The Site is largely to be occupied by hardstanding, minimising the risk of direct exposure to any below ground soil contamination. However, soft landscaped areas are proposed at the Site and it is likely that a clean cover system of suitable for use topsoil will be required.</p> <p>Dust suppression may be required during the development groundworks.</p> <p>Groundworkers should use appropriate personal protective equipment (PPE) and maintain good standards of hygiene to be protected from any soil contamination which may be present. Asbestos has been identified in the surrounding Site area by a third-party investigation, as well as the potential for asbestos within buildings on Site, as such all groundworkers will need to prepare suitable RAMs and PPE/RPE, where required, under their obligations with CAR2012.</p>

Preliminary (Geo-Environmental) Risk Assessment (PRA)

Stockley Park, Uxbridge
EGE-25-06-13-01

<p>and subsequent landfilling</p> <p>USTs and historical leaks off-Site to the west located within the GSK Site</p> <p>Elevated concentrations of soil & groundwater contaminants and hazardous ground gas identified across the Stockley Park site areas to the west as part of third-party investigations</p>	<p>Leaching of contamination into groundwater.</p> <p>Vertical and lateral migration of contamination through permeable deposits below the Site, including potential on-Site soakaway.</p>	<p>Principal Aquifer (Lynch Hill Gravel Member - if present)</p> <p>Ponds located 30 m east and the Grand Union Canal located 225 m south</p>	<p>Low to Moderate Risk</p>	<p>The potential for significant and widespread groundwater contamination is considered to be Low to Moderate due to the potential for relict contamination from historical quarrying and subsequent landfilling, however, it is noted that a large scale remediation project was undertaken to create the building platform which the current office buildings are located upon. Furthermore, other potential sources of contamination on-Site include the potential for deep Made Ground, the electrical sub-stations, car park use, asbestos within buildings and the off-Site potential sources.</p> <p>Whilst the Site is mapped with a Principal Aquifer in relation to the underlying superficial deposits, the Site lies within Stockley Park which is a remediated opencast quarry / landfill, as such, the groundwater sensitivity of the immediate surround area is considered to be low. Furthermore, elevated concentrations of contaminants have been identified in ground water off-Site by third-parties but still within the remediated Stockley Park area.</p> <p>The Site is not located within a Source Protection Zone (SPZ). Furthermore, no SPZs are located within 1.0 km from the Site.</p> <p>There are 25 no. groundwater abstraction and 3 no. surface water abstractions records within the Envirocheck report located within 1.0 km of the Site, however, none are related to potable water.</p> <p>It is however, recommended that environmental investigation is undertaken across the Site to confirm the ground conditions and risk to the identified receptors, with validity groundwater sampling to support likely Environment Agency (EA) requirements.</p>
	<p>Direct infiltration in water supply pipes.</p>	<p>Service conduits.</p>	<p>Moderate Risk</p>	<p>Potential sources of contamination have been identified and it is recommended that environmental investigation is undertaken across the Site to confirm soil conditions and risk to service conduits. Thereafter, the findings of any environmental investigation at the Site should be provided to the Local Water Provider who will confirm any requirements for upgraded water supply pipes, if new installations are required as part of the new development. Should new potable water installations be required,</p>

Preliminary (Geo-Environmental) Risk Assessment (PRA)

Stockley Park, Uxbridge
EGE-25-06-13-01

				upgraded water pipes should be anticipated at this stage given the developed nature of the Site.
Hazardous ground gas (on-Site deep Made Ground and potential landfill, Off-Site deep Made Ground and Landfilling)	Accumulation of gas in enclosed spaces and sub-floor voids.	Buildings and future Site users.	Moderate Risk	<p>Potential sources of ground gases have been identified (on-Site deep Made Ground and potential landfill, Off-Site deep Made Ground and Landfilling).</p> <p>It is understood that ground gas protection measures have been installed in the surrounding Site area as identified by third-parties.</p> <p>It is recommended that ground gas monitoring is undertaken across the Site as part of any ground investigation.</p> <p>Vigilance is required during groundworks for any suspect ground conditions, such as deep Made Ground, organic or deleterious materials and organic contamination which may present a potential source of hazardous ground gas.</p>
Radon	Accumulation of radon in enclosed spaces and sub-floor voids.		Very Low Risk	<p>Reference to the Envirocheck report indicates the Site is in a Lower probability radon area (less than 1% of homes are estimated to be at or above the Action Level).</p> <p>No radon protective measures are necessary in the construction of new developments.</p>
Potential for asbestos within buildings present on-Site	Inhalation of asbestos fibres.	Groundworkers during the redevelopment or during any sub-surface maintenance works.	Moderate Risk	A pre-demolition asbestos survey should be carried out by an appropriately experienced and qualified asbestos surveyor.

Risk Definitions are provided as Appendix VI.

4.0 Conclusions and Recommendations

On the basis of the Assessment the following conclusions and recommendations can be made.

<p>Soils</p>	<p>The potential for significant and widespread soil contamination is considered to be Low to Moderate due to the potential for relict contamination from historical quarrying and subsequent landfilling, however, it is noted that a large-scale remediation project was undertaken to create the building platform which the current office buildings are located upon. Furthermore, other potential sources of contamination on-Site include the potential for deep Made Ground, the electrical sub-stations, car park use, asbestos within buildings and the off-Site potential sources.</p> <p>It is recommended that environmental investigation is undertaken across the Site at the time of any geotechnical assessment to confirm the soil conditions and risk to the identified receptors.</p> <p>A 'hotspot' protocol should be in place during the redevelopment for ground workers to act upon should suspected contamination be identified.</p> <p>Dust suppression may be required during the development groundworks.</p> <p>The Site is largely to be occupied by hardstanding, minimising the risk of direct exposure to any below ground soil contamination. However, soft landscaped areas are proposed at the Site and it is likely that a clean cover system of suitable for use topsoil will be required.</p> <p>Groundworkers should use appropriate personal protective equipment (PPE) and maintain good standards of hygiene to be protected from any soil contamination which may be present. Asbestos has been identified in the surrounding Site area by a third-party investigation, as well as the potential for asbestos within buildings on Site, as such all groundworkers will need to prepare suitable RAMs and PPE/RPE, where required, under their obligations with CAR2012.</p>
<p>Groundwater</p>	<p>The potential for significant and widespread groundwater contamination is considered to be Low to Moderate due to the potential for relict contamination from historical quarrying and subsequent landfilling, however, it is noted that a large scale remediation project was undertaken to create the building platform which the current office buildings are located upon. Furthermore, other potential sources of contamination on-Site include the potential for deep Made Ground, the electrical sub-stations, car park use, asbestos within buildings and the off-Site potential sources.</p> <p>Whilst the Site is mapped with a Principal Aquifer in relation to the underlying superficial deposits, the Site lies within Stockley Park which is a remediated opencast quarry / landfill, as such, the groundwater sensitivity of the immediate surround area is considered to be low. Furthermore, elevated concentrations of contaminants have been identified in ground water off-Site but still within the remediated Stockley Park area by third-parties.</p> <p>The Site is not located within a Source Protection Zone (SPZ). Furthermore, no SPZs are located within 1.0 km from the Site.</p> <p>There are 25 no. groundwater abstraction and 3 no. surface water abstractions records within the Envirocheck report located within 1.0 km of the Site, however, none are related to potable water.</p>

	<p>It is however, recommended that environmental investigation is undertaken across the Site to confirm the ground conditions and risk to the identified receptors, with validatory groundwater sampling to support likely Environment Agency (EA) requirements.</p>
Ground Gas	<p>The potential for ground gases/vapours to impact the proposed development is considered to be Moderate.</p> <p>A Ground Gas risk assessment will be required for the Site.</p>
Radon	<p>Reference to the Envirocheck report indicates the Site is in a Lower probability radon area (less than 1% of homes are estimated to be at or above the Action Level).</p> <p>No radon protective measures are necessary in the construction of new developments.</p>
Potable Water Pipes	<p>Potential sources of contamination have been identified and it is recommended that environmental investigation is undertaken across the Site to confirm soil conditions and risk to service conduits. Thereafter, the findings of any environmental investigation at the Site should be provided to the Local Water Provider who will confirm any requirements for upgraded water supply pipes, if new installations are required as part of the new development. Should new potable water installations be required, upgraded water pipes should be anticipated at this stage given the developed nature of the Site.</p>
Geotechnical Considerations and Foundations	<p>Reference to the British Geological Survey (BGS) online viewer and mapping BGS mapping (1:50,000 Sheet Number 269, Winsor) indicates the Site is underlain by superficial deposits of the Lynch Hill Gravel Member (sand and gravel). Thereafter, the Site is mapped as being underlain by bedrock of the London Clay Formation (clay, silt and sand).</p> <p>Furthermore, the Site is mapped on the British Geological Survey (BGS) online viewer and mapping BGS mapping as comprising 'Worked Ground - Void'. This likely relates to the open cast extraction of the superficial sands and gravels.</p> <p>Given the developed nature of the Site, Made Ground is anticipated. Finally, the Site is mapped as being located within an area of potentially infilled land (non-water) and as such the potential for deep Made Ground cannot be discounted at this stage.</p> <p>Groundwater within the BGS recorded historical borehole, located approximately 60 m west of the Site (Reference. TQ08SE208, dated April 1979) was noted to be between 1.78 and 1.85 m bgl.</p> <p>The specific geotechnical constraints and preliminary foundation considerations are as follows:</p> <ul style="list-style-type: none"> ▽ Traditional foundations may be unsuitable given that the Site is noted be underlain by reworked ground and / or landfilled materials; ▽ Potential for deep Made Ground, given the historical opencast quarrying, landfilling and remediation works on-Site; ▽ Potential for chemical attack on concrete from the Made Ground; and ▽ Given the Site is likely underlain by Made Ground, traditional soakaways are unlikely to be feasible form of surface water disposal;

Recommendations	<p>On the basis of the above, the following recommendations are made:</p> <ul style="list-style-type: none">▼ Environmental investigation across the Site to confirm the presence of any shallow soil and groundwater contamination and the associated risk to Human Health and Controlled Waters;▼ Geotechnical investigation is required to inform foundation design. The geotechnical investigation should include deep boreholes for pile design purposes;▼ Ground gas monitoring;▼ A 'hotspot' protocol should be in place during the redevelopment for ground workers to act upon should suspected contamination be identified;▼ Groundworkers should use appropriate personal protective equipment (PPE) and maintain good standards of hygiene, including undertaking RAMS in accordance with their obligations under CAR2012;▼ Dust suppression may be required during the development groundworks;▼ This Report should be provided to the local water provider to support any new potable water connection, if required; and▼ An asbestos survey should be undertaken by an appropriately qualified and experienced asbestos surveyor.

Appendix I - Standard Limitations

Limitations

The conclusions and recommendations made in this Report are limited to those that can be made based on the findings of the investigation and in the context of the proposed development.

Where comments are made based on information obtained from third parties, EGE assumes that all third party information is true and correct. No independent action has been undertaken to validate the findings of third parties, unless specifically stated.

This Report has been prepared in accordance with our understanding of current best practice. However changes to best practice, guidance or legislation may necessitate revision of this Report after the date of issue.

EGE has prepared this Report for the sole use and reliance of the Client, in accordance with our Standard Conditions and Limitations issued with the proposal. This Report may not be used or relied upon by any unauthorised third party without the explicit written agreement of EGE. Third parties use the information at their own risk.

Published 1868
Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2024

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Site Details

1&2, Longwalk Road, Stockley Park, UXBRIDGE, UB11 1BA

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1974 - 1975

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Natural England Copyright Notice

Site of Special Scientific Interest, National Nature Reserve, Ramsar, Special Protection Area, Special Conservation Area, Marine Nature Reserve data (derived from Ordnance Survey 1:10000 raster) is provided by, and used with the permission of, Natural England who retain the copyright and Intellectual Property Rights for the data.

Scottish Natural Heritage Copyright

Contains SNH information licensed under the Open Government Licence v3.0.

Ove Arup Copyright Notice

The Mining Instability data was obtained on licence from Ove Arup & Partners Limited (for further information, contact mining.review@arup.com). No reproduction or further use of such Data is to be made without the prior written consent of Ove Arup & Partners Limited. The supplied Mining Instability data is derived from publicly available records and other third party sources and neither Ove Arup & Partners nor Landmark warrant the accuracy or completeness of such information or data.

Stantec Copyright Notice

The cavity data presented has been extracted from the PBA (now Stantec UK Ltd) enhanced version of the original DEFRA national cavity databases. Stantec UK Ltd retain the copyright & intellectual property rights in the data. Whilst all reasonable efforts are made to check that the information contained in the cavity databases is accurate we do not warrant that the data is complete or error free. The information is based upon our own researches and those collated from a number of external sources and is continually being augmented and updated by Stantec UK Ltd. In no event shall Stantec UK Ltd or Landmark be liable for any loss or damage including, without limitation, indirect or consequential loss or damage arising from the use of this data.

Radon Potential dataset Copyright Notice

Information supplied from a joint dataset compiled by The British Geological Survey and Public Health England. The probability result is only valid for properties above ground. All basement and cellar areas are considered to be at additional risk from high radon levels. If an underground room such as a cellar or basement makes up part of the living or working accommodation, the property should be tested regardless of Radon Affected Area status.

Appendix IV - Contaminated Land Enquiry Response

From: Contaminated Land <contaminatedland@hillingdon.gov.uk>

Sent: 30 June 2025 13:38

To: Paul Huteson <paulh@evolvegeo-env.co.uk>

Subject: FW: A contaminated land enquiry form LBH1750226580534 has been submitted

Dear Mr Huteson,

Good afternoon and thanks for contacting the London Borough of Hillingdon on your contaminated land enquiry for 1 Longwalk Rd, Hayes, Uxbridge UB11 1DB (The Site is currently a vacant office building and car park

adjacent to Stockley Park Roundabout. E: 507797, N:180292) attached dated 18 June 2025 07:03.

Having now taken time to review our record in relation to the questions raised in your request, please see below our response highlighted in red in front of your questions:

We are currently undertaking a Preliminary (Environmental) Desktop Assessment as the first stage of the contaminated land assessment for this Site in order to provide feasibility assessment prior to potential demolition and redevelopments new commercial units.

Please could you undertake a contaminated land search for the Site address (plans can be provided on request).

1. I am particularly interested in any details that you hold in respect to the mapped landfill on-Site and within 250 m, - From our land contamination record, we can confirm that, the site is part of a bigger site on a former potential contaminated Land Use identified as Landfills: Landfill which is now partly removed ('clean' inert material) located at Stokley Park (East) for mixed waste between 1950 – 1989 with likely gas risk as well as also within 250m of landfill buffer.
2. Type of waste deposited, licence holder, permit dates. – As previously advised, the site was used for deposition of mixed waste between 1950 – 1989.
3. Previous Site investigations - Of all the 14 previous planning applications for the site that we have reviewed, only one application has a record of Phase 1 Investigation for Desk Study Report and copy of this is available through our planning website using the link: <https://planning.hillingdon.gov.uk/OcellaWeb/planningSearch>. The relevant planning application is: 37103/APP/2022/3110.

4. Any associated pollution incidents or gassing measures in place. – We are not aware of any associated pollution incidents on the site but as of 28th September 2005 when the site record was last updated, we can confirm there was an active gas protection measure in place but this was said will be switched off but we can't confirm if this has happened or not.

5. In addition, are you able to confirm the site is not listed as a Part IIA Site (as per your website Contaminated Land) or listed as a priority site for contaminated land as part of the Councils contaminated land strategy.– Yes, the site has not been listed as a Part IIA Site (as per our website Contaminated Land) or listed as a priority site for contaminated land as part of the Councils contaminated land strategy. However, our land contamination record shows the site to be on a former potential contaminated Land Use identified as Landfills: Landfill which is now partly removed ('clean' inert material) as well as within 250m of landfill buffer. Therefore, any issue of contamination for the site will be address under a planning regime rather than under the Part IIA of the Environmental Protection Act 1990.

Please could you confirm the process for payment and associated turnaround times for undertaking the search?

We hope the above answer your query? Otherwise, feel free to let us know how else we can be of assistance.

Regards,

Environmental Protection Team (Contaminated Land)

London Borough of Hillingdon
Civic Centre
High Street
Uxbridge, UB8 1UW

Appendix V - Preliminary UXO Risk Assessment

Stage 1 Preliminary Explosive Ordnance Risk Assessment

Project: Stockley Park, Uxbridge

Client: Evolve Geo-Environmental Limited

Doc Ref: PRA.10262.25

Issue Date: 23rd June 2025

Conclusion(s)		
GI works	Explosive ordnance (EO) poses a Low Risk to the proposed works.	
Post-GI Development	There is a potentially elevated likelihood of EO encounter during the proposed works.	
Recommendation(s)		
GI works	No further action	To receive a Stage 2 DRA quotation: info@impartialassessments.com +44 (0) 207 126 8164
Post-GI Development	Stage 2 Detailed Risk Assessment to elucidate the risk.	

The Site

British National Grid Ref:
TQ 07790 80246

Site Address:
1 Longwalk Road
Stockley Park
Hayes
London Borough of Hillingdon
UB11 1DB

Note, the Stockley Park, Uxbridge site will subsequently be referred to as the 'Site'.

Introduction	
Introduction	<p>A preliminary risk assessment (PRA) is the first stage of the UXO (unexploded ordnance) / EO (explosive ordnance) risk management process. It is a qualitative screening exercise to assess the likelihood of encountering EO during ground works at a given site.</p> <p>The assessment considers the basic factors that affect the likelihood of buried EO being present at a given site today and the likelihood it will be encountered during the proposed works.</p>
Assessment methodology	<p>This desktop risk assessment has been researched and written by a dedicated EO risk analyst and is produced in accordance with CIRIA C681 (2009) and C785 (2019) guidelines on UXO risk assessment. As such, the assessment considers the following five factors:</p> <ul style="list-style-type: none"> ▶ Site location and Site history / occupancy ▶ Wartime UXO: German bombing, German shelling, and British and Allied anti-aircraft weaponry fire ▶ Domestic military activity: British and Allied armed forces activity during wartime and peacetime ▶ Mitigating Factors ▶ Extent of the proposed ground works <p>Note, the likelihood of EO initiation / detonation and consequence(s) of EO initiation / detonation are assessed at Stage 2, not Stage 1.</p> <p>The numerical preliminary risk rating calculation included within this PRA is a unique Impartial Assessments Ltd (IAL) methodology that makes for a transparent and accountable risk assessment process.</p>
Information sources	<p>This assessment draws on preliminary research utilising information sources immediately available to IAL at the time of writing. The availability of historical information will differ depending on the Site's location. As an absolute minimum, all IAL Stage 1 PRAs involve analysis of recent aerial photography, historic OS mapping, original WW2 bombing density records and our PIEO (potential indicators of explosive ordnance) GIS map. The PIEO map plots our vast database of locations and incidents of interest.</p>
Stage 1 objective	<p>The main objective of a Stage 1 PRA is to confirm whether or not further research is required to verify the EO risk. If a low risk cannot be confirmed at Stage 1, a Stage 2 Detailed Risk Assessment (DRA) will be recommended.</p>

The Site and Proposed Works		
Current Site Occupancy	<p>A post-WW2 commercial development comprising two two-storey office buildings with car parks and soft landscaping.</p>	
Historic Site occupancy (OS maps review)	Pre-WW1	<p>Farmland. Latterly, a neighbouring brickworks may have affected the Site.</p>
	Interwar / Pre-WW2	<p>Largely remaining open ground, with a small building in the southwest.</p>
	Post-WW2	<p>Part farmland, part disturbed open ground by the late 1940s.</p>
Proposed Works	<p>Redevelopment will see the existing buildings demolished and replaced by two warehouses (occupying a similar footprint). The foundation solution will be deep piled due to a history of landfill. Various shallow mechanical excavations will also be required.</p> <p>Prior to redevelopment, a GI will be undertaken comprising deep boreholes for pile design and trial pits.</p>	

Enemy Action during WW1

German Aerial Bombing	Did any bombs fall within 1km of the Site?	No
German Naval Shelling	Did any warship artillery shells fall within 1km of the Site?	No

Enemy Action during WW2

German aerial bombing

Indicator		Assessment	
Bombing Targets	Confirmed by the Luftwaffe	Original Luftwaffe target records highlight the Fairey Aviation propeller factory (~1.5km southeast of the Site) as the closest bombing target.	
	Unconfirmed secondary / opportunistic	Several large industrial works within 1km of the Site, including Royal Ordnance Factory (ROF) Hayes ~500m south of the Site, which manufactured tanks and guns during WW2.	
Bombing Density	The Administrative Area	<p>What bombing density was experienced by Yiewsley & West Drayton Urban District (within which the Site was located at the time)?</p> <p>Low-to-Moderate bombing density (24.8No. 'iron' bombs / 1,000 acres)</p> <p>Note, this is the official government bomb census figure. 'Iron' bomb refers to large (>40kg) thick-steel-cased bombs (most of which were high explosive filled). The bomb census did not report the numbers of small (1kg / 2kg) incendiary bombs (IBs), millions of which were dropped on the UK. It should also be noted that IAL's previous research has proven this record type inaccurate on a number of occasions.</p>	
	The Study Area	<p>What is the likelihood that the figure above (for the administrative area as a whole) accurately represents the immediate study area?</p> <p>Moderate / High</p> <p>Note, the bombing density figure for a whole administrative area is not always a good indication of the bombing density at a given site. Within larger administrative areas, particularly rural districts, bombing density may be skewed by the presence of a single heavily bombed target, e.g. a military airfield.</p>	
Air Raid Frequency		An original official record references 10No. air raids affecting Yiewsley.	
Bombing Decoy Sites		Were any British bombing decoy sites installed within 3km of the Site?	No
Bomb Damage		Has initial (partial) research located evidence of potential bomb damage (e.g. OS-mapped 'ruins', clearance, redevelopment) in the vicinity of the Site?	No
Bomb Strikes		Has initial (partial) research located evidence of a bomb strike(s) within 500m of the Site?	Yes
		Note, analysis of all Site-specific original bombing incident records is beyond the scope of a Stage 1 PRA. Some such records are unavailable within the time frame of a Stage 1 PRA.	

German land-based (French coast) artillery shelling

Is the Site located within one of the areas of Kent that experienced cross-Channel artillery bombardment?	No
---	----

Domestic Military Activity			
EO Contamination Source	Assessment		
Anti-Aircraft (AA) Artillery Fire	During WW1	There were four static AA gun batteries within firing range of the Site and a low likelihood of mobile AA gun deployments to the wider study area.	
		German Luftstreitkräfte activity in the region (to the southeast) was frequent however low intensity. These guns are unlikely to have expended a significant quantity of ammunition in the direction of the Site.	
		Note, many AA guns were mounted on vehicles so that they could be moved between vulnerable points. The number of active guns within firing range of a given site could therefore have been higher.	
	During WW2	17No. heavy AA gun batteries (HAA) were active within firing range of the Site.	
		At least 14No. 40mm calibre LAA guns were deployed within autocannon firing range of the Site, although not for the full duration of the local Luftwaffe bombing campaign.	
		No U.P rocket projector (ZAA) batteries were established within firing range of the Site.	
		German Luftwaffe activity in the wider area was high frequency and high intensity. These locally deployed AA weapons will likely have expended a significant quantity of ammunition.	
		Notes. Numerous LAA gun deployments (in defence of vulnerable points) were only temporary. During the early years of the conflict many static batteries were not armed due to a lack of available weapons. In the summer of 1944, there were large-scale inland deployments of LAA and HAA guns to parts of Kent, East Sussex and the Thames Estuary.	
Military Bases / Installations	Were / are there any British or Allied nation sites located within a significant distance of the Site?	No	
Military Training Areas / Weapons Ranges	Were / are there any British or Allied nation sites located within a significant distance of the Site?	No large, established ranges.	
Munitions or Explosives Factories	Were / are there any such sites located within a significant distance of the Site?	No	
Munitions Storage Depots	Were / are there any such sites located within a significant distance of the Site?	No	
Wartime Requisition	What is the likelihood that the Site was requisitioned by the government for temporary (wartime) military use?	Moderate	
Defensive Measures and Fortifications	Did the Site occupy an area that was fortified against the anticipated German invasion of WW2 (or to a lesser extent, WW1)?		No
	Has initial research highlighted any fortifications or other defence measures within 1km of the Site?	Yes. However, all these fortifications were positioned to protect ROF Hayes (>500m away).	
	Could defensive minefields have been laid in the vicinity of the Site during WW2?		No
	Could WW2 Home Guard (HG) soldiers of the local unit conceivably have utilised the Site for any potentially significant activities?		Yes

Local EO Finds		
Has evidence been found confirming or indicating an EO find(s) in the vicinity of the Site?		No

Key Findings and Risk Factor Scoring

Likelihood of EO Contamination	German UXO	Is the study area known to have experienced or probably did experience an elevated WW1 and / or WW2 bombing density?		Yes
		Did the Luftwaffe earmark any targets within 3km of the Site for attack?		Yes
		Would the study area have been vulnerable to small-scale random / indiscriminate bombing? i.e. due to proximity of heavily bombed urban area or an individual / isolated primary target.		Yes
		Evidence of an officially abandoned unexploded bomb (UXB) in the vicinity?		No
		Has preliminary research identified evidence of bombing within 500m of the Site, direct evidence (e.g. recorded bomb strike) or indirect evidence (e.g. structural damage or bomb crater)?		Yes
		Did (or could) the Site boundary have encompassed risk elevating ground cover during WW1 and / or WW2?		Yes
		Could part(s) of the Site have been neglected / inaccessible during WW1 and / or WW2?		Yes
	Additional observations / considerations.	Preliminary research has identified one bomb strike within 400m of the Site during WW2, however detailed research could highlight additional local incidents. The wartime isolated and undeveloped nature of the Site (comprising risk elevating ground cover types) significantly increases the likelihood of UXBs occurring unwitnessed (during night time raids) and also going subsequently undetected.		
	British / Allied EO	Was AA weapon ammunition expenditure significantly elevated within firing range of the Site during WW1 and / or WW2?		Possibly
		Could an unexploded AA projectile strike have gone undetected / unreported on Site, due to risk elevating wartime occupancy / ground conditions?		Yes
		Has evidence of wartime or peacetime military activity affecting the Site been identified?		No
		Does the Site's location / position / occupancy raise the possibility of temporary wartime military activity affecting the Site? e.g. invasion defences activity or military requisition.		Possibly
		Could HG soldiers have intentionally buried / discarded live ammunition on Site during WW2?		Possibly
Additional observations / considerations.	Pits were frequently requisitioned for HG training (involving live ammunition) during WW2. The post-WW2 landfill activities may indicate pit-like conditions occupying part of the Site during WW2.			
Scoring - Contamination Factor			2	

Likelihood of EO Remaining	How many cycles of redevelopment have affected the area of the proposed ground works?		One
	Does the Site currently contain any greenfield land or WW2-era brownfield land?		No
	Does undisturbed WW2-era soil / made ground / geology (that could be EO contaminated) remain at shallow depths (<2.0m bgl) on Site today?		Possibly

	Does undisturbed WW2-era geology (that could be German UXB contaminated) remain at deeper depths (>2.0m bgl) on Site today?	Yes
	Has evidence been found confirming that the U.K armed forces have carried out EO clearance (EOC) activities on Site, recently or historically?	No
	If no evidence of EOC activity affecting the Site is immediately available, what is the likelihood that parts of the Site have been surveying / searched for EO by the U.K armed forces?	Low
	Additional observations / considerations.	The Site appears to have experienced landfill activities post-WW2 and possibly during WW2. This would have buried any buried EO to greater depths.
Scoring - Risk Mitigation Factor		3

Likelihood of Encounter	Will the proposed ground works disturb the zone of potential EO contamination (ZPC)?	Yes	
	To what degree (volume of soil / geology) will the proposed ground works disturb the ZPC?	Low and Moderate	
	Are higher risk intrusive methodologies planned (e.g. boreholes, piling, vibro stone columns)?	Yes	
	Will the / any proposed GI works disturb a significantly lower volume of the ZPC than the / any post-GI development ground works, or vice versa? Or does the requirement for 'blind' borehole works (higher risk methodology) mean the EO risk is greater during the initial GI works?	Yes	
	Scoring - Proposed Works Factor (GI)		2
	Scoring - Proposed Works Factor (Post-GI Development)		3

Preliminary (Indicative) Risk Calculation

The preliminary risk rating calculation involves three factors:

- ▶ The likelihood of EO contamination (Site location and history)
- ▶ The likelihood of EO remaining on Site today (the extent of any risk mitigating factors)
- ▶ The likelihood of EO encounter during the proposed works (the type, volume and depth of proposed ground disturbance)

Each factor is numerically rated (**up to 5**). For 'likelihood of EO contamination' and 'likelihood of EO encounter', **zero** is the lowest likelihood.

For 'likelihood of EO remaining', **five** is the lowest degree of risk mitigative activities.

When added together, a final score of **eight or more** triggers the recommendation of a Stage 2 DRA.

Proposed Works	Contamination	Risk Mitigation	Proposed Works	Risk Rating Calculation	
	0 = lowest 5 = highest	1 = highest 5 = lowest	1 = lowest 5 = highest		
GI works	2	3	2	2+3+2=	7
Post-GI Development	2	3	3	2+3+3=	8

Further research is required to elucidate the EO risk.

A Stage 2 Detailed EO Risk Assessment is recommended prior to the proposed redevelopment / build works commencing.

IAL has exercised all reasonable care, skill and due diligence in preparing this risk assessment. However, a low-risk conclusion at Stage 1 PRA does not mean 'no risk'. For example, it is impossible to identify locations where members of the public have previously buried unwanted (often inherited) EO on private land (such as residential back gardens). Such EO contamination is not uncommon.

IAL cannot be held responsible for any inaccuracies or omissions within any records / information relied upon to carry out this PRA.

IAL is not liable for any relevant records / information that has become available subsequent to this PRA's issue date.

IAL cannot accept liability for subsequent changes to Site conditions that could affect the risk level.

At the time of writing, the relevant UK construction industry guidelines on explosive ordnance risk assessment (CIRIA) were adhered to. Subsequent revisions to these guidelines or new guidelines / legislation may render part(s) of this report obsolete. Reliance on the findings of this report must therefore be limited accordingly. Such reliance must be based on the whole report and not on extracts which may lead to incomplete or incorrect conclusions when taken out of context.

This report has been prepared for the exclusive use of the client (named on Page 1). Any third party relying on any information, conclusion or recommendation contained within this report, does so at their own risk.

Appendix VI - Risk Ratings

Risk Definitions	
Significance Level	Definition/Comments
Very High Risk	<p>There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening.</p> <p>This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required.</p>
High Risk	<p>Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the longer term. Likely contaminated land situation, risk assessment and action recommended.</p>
Moderate	<p>It is possible that harm could arise to a designated receptor from an identified hazard. However, is either relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild. Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term. Plausible contaminated land situation, risk assessment and possible action recommended.</p>
Low Risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild. Unlikely contaminated land situation, possible risk assessment and possible action.</p>
Very Low Risk	<p>There is a low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe. Negligible risk, no action recommended except vigilance for changes in conditions.</p>
